announced will still then only be a fraction of that small group--it wouldnt
warrant a serious effort among game developers to create titles for an obscure
machine with an even more obscure attachment.

Amiga CD^32 users have it lucky--they already have all the equiptment to pull
it off, they already have huge numbers (in upwards of half a MILLION CD^32
units in the UK/Europe..Not to mention 4 million Amiga users already!), and

they already have FMV capability.

Dont get me wrong, however--I like the Jaguar. I also like the CD^32. Each machine has its share of technical superiority over the other, in certain areas-- However, its in my opinion that the Jaguar is entering the "fight" ill equipped, undersupported, and overrated.

Nowadays it seems that the only thing the Jaguar has over the CD^32 is marketing hype. Atari may have dug its down grave by claiming such absurdities as "850 million Gouraud-shaded pixels per second" and then a week later releasing a game with barely more pep in it than Starfox for the SNES. Atari needs to understand that unlike the Amiga, they have no laurels to rest on. They must either perform (and perform ASTOUDNINGLY) or lose.

Hi all !!

Is it the way things go on the net or am I just a newcomer,

Why are there so much flames around in this group ???

Can't we live together ? Even ignoring the other, but not

shorten bandwidth with such annoying posts like

"My machine is the best, because its made by ......" and then followups like

"No my machine IS the best, because its made NOT by ...."

I am fed up to see over 80% of the posts to be such flaming wars.

Ciao

: >Of course, the standard key equiv's should be used, "D" for don't save,
: >esc for cancel, and return for Save.

: Of course for a Mac person this would be best... but then again what do Mac
: people know??? ;) (just a joke!) Anyway, I think that "Cancel" is the
: safest approach, since it neither loses the data or wastes HD space with
: lots of "Untitled XXX" files. However, I believe in power to the user, and
: if the user selects Quit, the default SHOULD be to actually Quit!!!!! If
: they are so dumb as to not notice the dialog, then they deserve to lose their
: data. But then again, Apple's market share seems to be all the dumb people
: in the world... (again :)

I think you'll find nearly all style guides, from AmigaDOS, Windows,
Mac System 7 and Acorns Risc-OS 3 have similar guidelines on requestors/
dialogue boxes. It saves the user from having to do more work (read
the entire requestor). Having the same option in the same place makes
it much easier to learn.

Just quitting and losing your work is stupid. You obviously haven't
had to spend a lot of time working on a project. When was the last
time you saved? Can you remember what revisions you have made to
the project? Ever clicked on the wrong box, picked the wrong menu
or had the wrong key switches/flags toggled?

If Atari's operating system recommends "if a user is stupid enough
to quit, then they should lose their work", I can see why there's
so few Ataris out there ;-) Perhaps link all unknown commands from
the shell to uncondtional format too, "because if they so stupid
not know the command, they shouldn't be using a computer".

: must be fantasies dreamed up in some marketing ploy!

Not really... We're discussing the Jaguar, aren't we? So, how do you
expect me to believe all the rumors going on? If somebody told you that
the Jaguar _only_ had an MC68000 processor, and nothing else, would you
believe that? Probably not. All I want is some _real_ info, not just
people claiming that "some guy told me", or "I've heard that"... And
Atari hypes don't count. Atari has a habit of enlargening things that
happen to carry its name.
Now, I've seen the CD32, I've tried it out. It is based on old Amiga
technology - it's basically an Amiga 1200, and I own one of those myself.
Isn't it natural to be a bit sceptic about all the incredible Jaguar specs
being thrown all around the place?

Have fun, Kristofer.

P.S. I don't wanna fight you, so there's no need for hitting me!

: writes:
: > I own an Amiga 1200. The HAM8 fringing is barely noticeable. *But* you
: > can only have 262,144 colors on a HAM8 screen. Well, you _could_ have more,
: > but in all the nice color fades, the steps would nearly all be 18-bit. So,
: > for a picture with many different colors, HAM8 is perfect.

: No, it's not perfect. I'm sure you can contrive a picture for which it is
: perfect, but for an average 24-bit color picture HAM8 cannot perfectly
: display that picture. There will be color fringing artifacts due to the
: inherent nature of the HAM technique. Now, whether the average person
: would notice much of a difference between the 24-bit picture and a HAM8
: version of the picture is a different matter. But HAM8 inherently cannot
: perfectly represent an arbitrary 24 bit/pixel image.

I meant that those pictures are best suited for HAM8. Of course they will
still not be identical to a 24-bit display. But you can have HAM8 in higher
resolutions due to the memory-efficient storage. A 500kB uncompressed HAM8
image would look just as good as a 500kB uncompressed 24-bit image (provided
that the higher resolution is supported by the display hardware).

: > It's nice for pictures, though - but so is HAM8.

: Maybe HAM8 is good for looking at still pictures, but not for things like
: image processing or photographic editing. HAM8 requires (lossy)
: translations back and forth between the HAM format and a direct mapped
: color scheme (e.g., RGB or YUV) when doing these types of operations.

Who will use a Jaguar for image processing? And who will use a CD32 for it?
None, as an answer to both questions. And, when will you ever learn...
You don't store single HAM8 images (except for the sole purpose of
displaying them), you use HAM8 as a display method for 24-bit pictures,
and for animations!

: > (For all of you who don't know, if you set a component, only the top 6 bits
: > are affected. The lower two are left intact. So by carefully setting up the
: > palette, you can have a different color on every pixel on the screen in any
: > screen resolution, up to 1400x600 50Hz-interlace, or 800x600
: > 72Hz-interlace.)

: Sigh... You misunderstand. The strength of a 24 bit/pixel display isn't
: that every pixel on the screen can be a unique color. It's that for every
: pixel on the screen you can _choose_ the color you want it to be from a
: palette of 16 million colors. HAM8 does not allow this since the color of
^^^^^^^

Where's the palette? :)

: many/most pixels on the screen is related to the color of the previous
: pixel.

I know that. That's why I wrote earlier that the HAM8 display is essentially
18-bit.

The four major graphics uses and the solutions available on the Amiga:

1) For displaying still pictures, HAM8 can have higher resolution than
24-bit pictures of the same storage requirement. The result will look
just as good.

2) For image processing, you usually have a powerful processor, and can thus
easily adjust the HAM8 image on screen according to the changes in the
24-bit image. Only the 24-bit image is saved to and loaded from disk.
The image on-screen is approximately 18-bit, which is quite sufficient for
previewing. (If you object to this, remember that the Falcon's palette is
no more than 18-bit!)

3) For full-screen animation, HAM8 is much faster than true 24-bit, and gives
far better results than 256-color animations.

4) For games and other non-predictable alterations of the displayed image,
24-bit would be too slow anyway, so you'll just stick to 256-color.

One final word: If you consider the HAM8 format as being "lossy", then what
would you call the Falcon's 16-bit TrueColor modes? They are fare more lossy
than HAM8 is. The fact that converting 24-bit pictures to HAM8 takes more
processing than converting them to 16-bit TrueColor is not a big point - also
remember that HAM8 images take up half the space, and thus leaves the other
half of the bandwidth for the processor to do the conversion. And all Amigas
used for image processing have fast memory in addition to the chip memory,
which will make the conversion even faster.

Regards, Kristofer.

|> I recently read that Atari has finally released their 64bit console.
|> Do any one have the specs for it. I just interested in what sort of hardware
|> it using.
!!!!!!!!!!!!!!! What do you think everyones spent the last 3-4 months arguing over!!!!!!!
The specs have been regularly and deeply discussed. here they are again. They have been editied and commented by someone who was present at the Atari trade launch.

* 64-bit RISC multiprocessing architecture.

* High-speed (106.4 Mbyte/sec) 64-bit data path

* Five processors:

> 27 MIPs Graphics Processor with 4K bytes of zero wait-state internal SRAM that is closely coupled to the blitter, that can perform a full range of graphics effects (including shading and rotations) at high speed, yet is programmable for maximum flexibility.

> A programmable Object Processor that can act as a variety of different video architectures, such as an advanced sprite engine, pixel-mapped based systems, character-mapped based systems, and many others.

> 27 MIPs DSP [Digital Signal Processor] with 8K bytes of zero wait-state internal SRAM for CD-quality sound and full stereo capabilities.

> A blitter that can perform a full range of logical operations at high speed, with hardware support for Z-buffering and Goudraud shading.

> MC68000 CPU clocked at 13.3MHz as a general purpose control processor.

[Five processors do not equal five chips; see below]

* Lifelike quality 32-bit color on NTSC or PAL television screens, yielding greater than 16 million colors (16,777,216 exactly).

* Screen resolution of 720 x 576.

* ROM cartridge capacity to 48 megabits [6 megabytes] of compressed or uncompressed code. When compressed, equivalent to almost 400 megabits. [50 megabytes?!?]

* 16 megabits [2 megabytes] of fast page-mode DRAM.

* An optional double speed CD-ROM drive. ($200, sometime during 1994)

* ComLynx I/O for networked multiconsole games (even with Lynx and Jaguar mixture).

[I smell a Lynx adaptor for the Jaguar in here. And the idea of chaining Jaguars and Lynxes is tantalizing]

* Two (expandable to literally dozens) enhanced controller ports, supporting digital and analog interfaces, as well as keyboards, light guns and mice.

[Expansion probably by a multiple-port tap, naturally]

* High performance, ergonomically designed, controller with joypad, three fire buttons, Pause, Option, and 12-key keypad with game-specific overlays. ["Ergonomically designed"? Definitely press release hype]

* High speed synchronous serial port for connection to modems, cable TV, networks and other high performance networks.

There are two custom chips, code-named Tom and Jerry, which combined contain four processors. Jerry has the DSP, the 8K SRAM, a sound block and a block for "timers, UART, joysticks and clock control." Tom has the "DRAM memory controller, object processor, GPU (w/ 4K SRAM) and the blitter." The 68000 is separate as it has the DRAM and cartridge/CD-ROM ties.

|>
|> Get a fucking clue, pal. RAM expansion cards for modern PCs (INCLUDING your
|> Falcon) are the size of shoeboxes for a reason.
first out, RAM expansion isn't always the size of a shoebox. Ever heard of PCMCIA cards?
If you bothered to open you dumn-fuck eyes and *read* what people have written and thought about it (can you do any of this stuff?), you'd see that the Jag compresses the data to get about 50mb on a cart. The cart doesn't have 50Mb of RAM, it holds 50Mb of data by compressing the data using an efficient compression system much like JPEG. If you don't understand compression algorithms and the concepts we are talking about then go and read up on it.

|> Hell, a friend of mine installed a 16-megabyte RAM expansion board on the

Very true. Nearly all demos that do anything remotely impressive have huge banks of pre-computed graphics. You can't do most of that stuff in real-time, at least not with an Amiga/ST sort of system.

|> Do you have to buy an Amiga-mag to see the CD32? I bought GamePro .. :-)

It's got to be admitted, Rickard, the CD32 is shifting some serious units. In the UK it's in every shop and all the shops I have spoken to say they can't get enough of them and that's with only 2 games on sale in the UK! I know back in Sweden it's not doing business but your doing yourself an injustice to keep pushing this 'CD32 is dead' line.

>they already have FMV capability.

Watch the jaguar catch up very quickly. Don't stop the race as soon as the opponent enters.

>Dont get me wrong, however--I like the Jaguar. I also like the CD^32. Each
>machine has its share of technical superiority over the other, in certain
>areas-- However, its in my opinion that the Jaguar is entering the "fight" ill
>equipped, undersupported, and overrated.

Please. Tell me how CD32 is technically superior in any aspect. And please don't use the CD, the Jaguar will have it as an option. If Atari scraps the CD, than you can use it in your argument.

>Nowadays it seems that the only thing the Jaguar has over the CD^32 is
>marketing hype. Atari may have dug its down grave by claiming such absurdities

And 64-bit RISC chips, and CD quality sound (generated by the machine, not spooled off the CD), and a 64-bit data bus, and the ability to display as many colors as pixels on the screen, and a keypad for more complex games, and...

>as "850 million Gouraud-shaded pixels per second" and then a week later
>releasing a game with barely more pep in it than Starfox for the SNES. Atari

Have you played it? Tell me ONE game that can match its performance with that many shaded polygons and missiles, and not in the middle of space where there is no ground to deal with.

>needs to understand that unlike the Amiga, they have no laurels to rest on.
>They must either perform (and perform ASTOUDNINGLY) or lose.

Cybermorph performs. And it's the first game, and a pack-in. Just wait and see what people write for this system.

)>
)
)Much the same way as Jaguar fans fell for the laughably bloated "850 million
)gouraud shaded pixels per second" marketing BS? :)

Well, you may say "850 million Gourad shaded pixels/sec", but the
figure ATari quotes is 850 million pixels/sec (1-bit pixels, no flames
please). They also quote 50M gourad shaded pixels/sec.

)
)Like most people, I agree that it is technically unfeasable to have full-motion
)video sequences from a -cartridge-, ala Jaguar..Due to the Jaguar's limitation
)when it comes to cartridge capacity.

Why is this infeasable? Sure you wont have more than a few seconds,
but it is possible - admit it!!

)
)On the other hand, on the Amiga CD^32,such a task is not only possible, but I'd
)even go so far as to say -very WELL EQUIPPED- to perform suck tasks due to its
)pre-existing CD-Rom.
)

Well of course the CD-ROM is good for this, 'cause it holds alot. The
Jaguar will have one in a while. And we have yet to consider the
issue of having a game be any better by adding movie footage.

)The numbers of Jaguar users alone is still quite small--the number of Jaguar
)users in the future who will buy the supposed CD-Rom addon when/if it is
)announced will still then only be a fraction of that small group--it wouldnt
)warrant a serious effort among game developers to create titles for an obscure
)machine with an even more obscure attachment.
)

Really? There is more demand for Jaguars than Atari has been able to
fill yet (sound familiar?). Lot's of people will ave them, and the
Jag CD will be released soon after the Nationwide release, meaning the
Jag CD will be with the machine almost from the start.

)
)Amiga CD^32 users have it lucky--they already have all the equiptment to pull

)it off, they already have huge numbers (in upwards of half a MILLION CD^32
)units in the UK/Europe..Not to mention 4 million Amiga users already!), and
)they already have FMV capability.
)

Yep, half a million, uh-huh.

)Dont get me wrong, however--I like the Jaguar. I also like the CD^32. Each
)machine has its share of technical superiority over the other, in certain
)areas-- However, its in my opinion that the Jaguar is entering the "fight" ill
)equipped, undersupported, and overrated.
)

Where is the CD-32 superior (except for including a CD-ROM).

)Nowadays it seems that the only thing the Jaguar has over the CD^32 is
)marketing hype. Atari may have dug its down grave by claiming such absurdities
)as "850 million Gouraud-shaded pixels per second" and then a week later
)releasing a game with barely more pep in it than Starfox for the SNES. Atari
)needs to understand that unlike the Amiga, they have no laurels to rest on.
)They must either perform (and perform ASTOUDNINGLY) or lose.
)

That is your claim,. Atari has never said that. And Cybermorph is a
lot more impressive than Starfox!!

The CD-32 must also perform, just porting lame A1200 titles will be
its doom if they don't get something impressive out.

Stefan,

If you're doing graphic text, why in the world would you be doing it in a 24-bit mode anyways? And if you do need to do graphic text in a video game, I'd say that 95% of the time, it would be animated or color cycled and would probably be prominently displayed so the player would be able to see it, and fringing wouldn't be a major issue.

Actually, if you'd ever used an Atari (which I doubt), you'd know
that behind every Quit button is a "verification" dialog. Any
programmer who DOESN'T implement that needs to stick to Amiga
programming.

# 3231. Re: CD32's HAM8 mode -IS- True 24-BIT color in some resolutions.

That's not what you said. You said they were "perfect".

> Who will use a Jaguar for image processing? And who will use a CD32 for it?
> None, as an answer to both questions.

No one, of course. But then this discussion has gone beyond the bounds of
just game/console machines (as indicated by your references to Amigas and
Falcons). All references in this thread for quite a while have been
general ones relating to display modes. As such, I'm treating this as a
general discussion of display modes.

[... from a previous portion of the message...]
> But you can have HAM8 in higher

> And, when will you ever learn...
> You don't store single HAM8 images (except for the sole purpose of
> displaying them), you use HAM8 as a display method for 24-bit pictures,

Wait a minute. First you say the benefit of HAM8 is for memory efficient
storage, then you say it's only for display of images stored at 24
bits/pixel. Which is it? Where's the benefit of using HAM8 for display
only if you have to store the image at 24-bit resolution? The conversion
to HAM8 takes longer than the time to transfer the full 24-bit image to
video memory.

> and for animations!

No argument here.

> : palette of 16 million colors. HAM8 does not allow this since the
> : color of
> ^^^^^^^
> Where's the palette? :)

The term palette is used in the artistic sense, of course. :-)
Actually, you do have a palette availble in direct mapped color modes

(i.e., not color index table). It has 16 million colors in it. Also, depending on the hardware implemtation, you may well have some control over those 16 million colors as some RAM/DACs permit mapping of pixel data through the color lookup table in direct color modes (and some DACs have greater than 8-bit resolution, too).

> : many/most pixels on the screen is related to the color of the previous
> : pixel.
>
> I know that. That's why I wrote earlier that the HAM8 display is essentially
> 18-bit.

But it's not 18-bit. Any pixel on a HAM8 display can't be any of 2^18 colors. You still have pixel-to-pixel color dependencies.

> One final word: If you consider the HAM8 format as being "lossy", then what
> would you call the Falcon's 16-bit TrueColor modes? They are fare more lossy
> than HAM8 is.

16 bits/pixel is certainly lossy if you're trying to display a 24 bit/pixel image. However, if your image is already in 16-bit format then it isn't lossy at all. Converting that 16 bit/pixel image to HAM8 would be lossy, however, as HAM8 still has interpixel color dependencies.

> The fact that converting 24-bit pictures to HAM8 takes more
> processing than converting them to 16-bit TrueColor is not a big point

Depends on the application, but this is probably true of a number of applications.

> - also
> remember that HAM8 images take up half the space, and thus leaves the other
> half of the bandwidth for the processor to do the conversion.

Don't equate bus bandwidth with processor bandwidth. They're two different entities. Depending on the system capabilities (memory architecture, DMA capabilities, cache size, etc.), you will almost certainly find that the above "half of the bandwidth" is not enough. In order to optimally process a HAM8 image you essentially have to scan the entire 24-bit source image to determine the best choice for the 64 fixed colors, and then go back an convert the image. By that time you could already have moved the entire 24-bit image to display memory.

Please get your facts straight. Atari never claimed 850 million
gouraud shaded pixels per second. Instead, in a Delphi conference,
they gave a figure of 50 million gouraud shaded pixels per second.

The figure of 850 million pixels per second probably refers to the
Jaguar's peak blitting speed.

>)write it to RAM. That adds up to 132 MB/s. Is 132MB/s more or less than
>)108MB/s ?

>Why are you reading the image then writing it back out to memory?

Because in a memory copy, you have to read some data from the source
address before you can write anything to the destination.
---

But for a lot of things you don't have to do this - for sprites, and
for 3D objects where you are shading stuff on the fly.

>If you're using sprites, then you just do a memory to memory copy. Also,
>why are we using 30FPS when something a bit lower (like 15-17fps)
>would do.

Because 15-17fps looks jerky. Neither the producer nor the consumer
wants jerky games.
---

I dn't think this looks too bad, though I'd say 15fps is probably a
lower limit.

<lots of stuff deleted>
One final word: If you consider the HAM8 format as being "lossy", then what
would you call the Falcon's 16-bit TrueColor modes? They are fare more lossy
than HAM8 is. The fact that converting 24-bit pictures to HAM8 takes more
processing than converting them to 16-bit TrueColor is not a big point - also
remember that HAM8 images take up half the space, and thus leaves the other
half of the bandwidth for the processor to do the conversion. And all Amigas
used for image processing have fast memory in addition to the chip memory,
which will make the conversion even faster.
------------------------------

He means lossy with respect to 24-bit graphics - and also you just
won't see any artifacts of any kind in a True-color mode.

Not all Amigas have fast-memory - what about the CD-32?

: > that the higher resolution is supported by the display hardware).

: > And, when will you ever learn...
: > You don't store single HAM8 images (except for the sole purpose of
: > displaying them), you use HAM8 as a display method for 24-bit pictures,

: Wait a minute. First you say the benefit of HAM8 is for memory efficient
: storage, then you say it's only for display of images stored at 24
: bits/pixel. Which is it? Where's the benefit of using HAM8 for display
: only if you have to store the image at 24-bit resolution? The conversion
: to HAM8 takes longer than the time to transfer the full 24-bit image to
: video memory.

Read again. "(except for the sole purpose of displaying them)". If you're
into image processing, stick to 24-bit graphics. Otherwise, have the rendered
pictures stored in HAM8 format.
Memory band width is limited. What I say is, that HAM8 is just as good/bad
as 16-bit TrueColor modes, except that it takes half the space. And you can
thus have double the resolution with the same DMA capacity. Of course a
1280x512 24-bit display is better than a 1280x512 HAM8-display, but how think
of the DMA requirement! (I don't think the Falcon can display 1280x512,
16-bit TrueColor, right? The Amiga can display 1280x512, HAM8, though.)

: > and for animations!

: No argument here.

Good thing!

: The term palette is used in the artistic sense, of course. :-)
: Actually, you do have a palette availble in direct mapped color modes
: (i.e., not color index table). It has 16 million colors in it. Also,
: depending on the hardware implemtation, you may well have some control
: over those 16 million colors as some RAM/DACs permit mapping of pixel data
: through the color lookup table in direct color modes (and some DACs have
: greater than 8-bit resolution, too).

News to me. Interesting... :)

: > : many/most pixels on the screen is related to the color of the previous
: > : pixel.
: >
: > I know that. That's why I wrote earlier that the HAM8 display is essentially
: > 18-bit.
:
: But it's not 18-bit. Any pixel on a HAM8 display can't be any of 2^18
: colors. You still have pixel-to-pixel color dependencies.

Of course you can _construct_ an 18-bit picture that will not be good when converted to HAM8, but that picture will have to be made up of lots of thin, vertical bars in different colors, which wouldn't be very useful to look at, anyway. On the other hand, natural (digitized) and rendered images will look very close to 18-bit when displayed in HAM8. Given high enough resolution, the difference will be infinitesimal.

: > One final word: If you consider the HAM8 format as being "lossy", then what
: > would you call the Falcon's 16-bit TrueColor modes? They are fare more lossy
: > than HAM8 is.

: 16 bits/pixel is certainly lossy if you're trying to display a 24
: bit/pixel image. However, if your image is already in 16-bit format then
: it isn't lossy at all. Converting that 16 bit/pixel image to HAM8 would
: be lossy, however, as HAM8 still has interpixel color dependencies.

I thought we were discussing 24-bit graphics here? I can assure you that an AGA-Amiga is capable of more photo-realistic images than a Falcon is. And I have never heard of any professional use of 16-bit images, whatsoever. 24-bit is the way to go, and those pictures look much better on HAM8 than on 16-bit TrueColor. As a parallel to your 'lossy or not lossy' discussion above: HAM8 is never lossy if you stick to displaying HAM8 images! - And the pictures load faster, too! :) :) Converting a HAM8 to 16-bit TrueColor will be just as lossy as the opposite.

: Don't equate bus bandwidth with processor bandwidth. They're two
: different entities. Depending on the system capabilities (memory
: architecture, DMA capabilities, cache size, etc.), you will almost
: certainly find that the above "half of the bandwidth" is not enough. In
: order to optimally process a HAM8 image you essentially have to scan the
: entire 24-bit source image to determine the best choice for the 64 fixed
: colors, and then go back an convert the image. By that time you could
: already have moved the entire 24-bit image to display memory.

Admitted. But the image will look better in HAM8.

It's your move! /Kristofer.

Erm - small point here. You cann't use JPEG on program code, so only the GFX
are compressed in this way - JPEG, in common with fractal compression is a LOSSY
algorithm, where what comes out resembles what went in, but isn't exactly the
same. Ok for pictures, but bugger all good for anything else.

Still, using a decent DCT chip, it's quite feasible to use this method for
fitting loads of GFX into a small space.

I don't really care one way or another - it's all games anyway. The fact is
that I have played on a CD32 and it was fun. But I've also played on an
original Nintendo & that was fun too. My old ZX81 was fun. No doubt the Jaguar
(if I ever see one) will be fun as well.

My falcon, of course, is more fun......

## 3240. HAM8 and the 64 base colors

Newsgroup: comp.sys.atari.advocacy
Date: 1993-11-30 16:39:32 UTC
From: cmedley@wam.umd.edu
Message-ID: <2dft04$n57@cville-srv.wam.umd.edu>
Source record: 20024

I've seen a lot of postings claiming fantastic things if you use the 64 base colors in HAM8, but what I think determines the usefulness of HAM8 for anything other than static viewing of images is whether or not it determines the 64 base colors for you with no CPU time or not.

If the 68020 has to figure out what the 64 base colors are, or if they are just preset, then it seems that it would be a slow process. For a 640x200 image, there would be 128,000 pixels to check to determine what the best 64 base colors would be, and each time those base colors were changed, wouldn't it affect pixels painted in the base colors BEFORE the change?

Technically, I think the HAM modes have been a godsend for those of us who use low-end computers (under $2000) but I do not think it is any substitute for a graphics mode that gives you 24-bits per pixel, or even 16-bits per pixel if you are doing image manipulation. And I would classify blitting images to the screen for a video game part of image manipulation because each time you paint on top of the backdrop, you are affecting the representation of the image.

(and this, I think, could be a pain if it creates "sparklies" on the display)

256 colors would probably be adequate to wow the low-end game market. I don't think they need to do more than that... and I think that's probably about the level of quality we'll see.

I suggest you pick up the latest issue of AmigaWorld (published here in the US)
..Has a front cover story on the CD^32 and its iminent launch here in North
America come January.

I also suggest you stop by your local large-scale bookstore, such as Barnes &
Noble, and take a look inside a few UK/European Amiga magazines, and youll find
them overflowing its reviews of CD32 games.

>the comment about the CD32 performing "suck tasks" B-)

The Jaguar CD, Atari has said, will be released in Semptember 1994, to build time for developers to make games for it. Atari will have already lost by then..Too little, too late.

>
>>The numbers of Jaguar users alone is still quite small--the number of Jaguar

>Conjecture and bullshit. Of course the number of Jag owners is small, it just
>came out a week ago, dimwit!

Reread what I said, and dont call me a dimwit. The number of Jaguar units is already guaranteed to be very small in Europe/UK due to the Amiga CD^32's presence, and the boost given by 4.5 million other Amiga users overseas. Europe is ours. Stateside, the number of Jagauar units will be small, and the number of Jaguar units equipped with this CDROM to supposedly be released in SEPTEMBER of 1994, will be even smaller--Game developers will have long since grown tired of waiting for Atari, and will switch to other more profitable platforms rather

than trying to continue their work for a machine that only offers promises, not actual physical products.

Also, considering that when the CD^32 is announced over here, Stateside, in January.. it will STILL be another, what, >>9<< months until Atari releases its CD attachment in September 94! To make matters worse, EUROPEAN Amiga CD^32 users will have CD-Roms for MORE THAN AN ENTIRE YEAR before Atari rolls out their CD peripheral.

>
>>Amiga CD^32 users have it lucky--they already have all the equiptment topull

The race will be already over by the time Atari shows up at the starting line, im afraid. Its a shame to see a good product go under due to slow garnering of support..

>
>Please. Tell me how CD32 is technically superior in any aspect. And please
>don't use the CD, the Jaguar will have it as an option. If Atari scraps the
>CD, than you can use it in your argument.

First of all, at this point, I think youde be better off saying that Atari ---MIGHT--- offer the CD as an option. Atari may very well go bankrupt if the Jaguar flops. Debuting the machine and selling it to the public in where 80% of the Jaguars have display interference problems dosent make for a very good first impression, now, does it?

Want a list of superior aspects of the CD^32 versus the Jaguar? Ok.

1) We already have double-speed multisession CD-Roms in EVERY CD^32 unit. Atari has set the date for its CD-Rom to be shipped in September of 1994. And even (when/if) Atari ships their CD-Rom attachment, still only a fraction of Jaguar owners will buy them. Meanwhile, all CD^32 users have them already, today, now.

2) The CD^32 has higher color capabilities at higher resolutions than the Jaguar.

3) The CD^32 has a 68020 CPU that offers roughly 4.5x as much horsepower as the Jaguar's 68000 CPU. And again, what good is the Jaguar's supposed "64-bit bus" if its only handling 16-bits worth of traffic? What good are

64-bit RISC GPU's if theyre only being told what to do by a slow 16-bit CPU such as the 68000 found in the Jaguar?

4) The CD^32 has a 32-bit access path to its 2 megabytes of RAM. 16-bit CPU's like the Jaguar's 68000 are incapable direct access to 32-bit memory. As a result, memory access is much slower, because the Jaguar is forced to use 16-bit memory..and having a slower CPU than the Amiga CD^32 makes matters worse..And believe me, when I tell you theres a massive speed increase between 32-bit RAM access and 16-bit ram access, I am NOT lying. From speed tests ive done on my own Amiga system, I can tell you that memory access going from/to 32-bit memory is roughly 10x faster than going to 16-bit memory. (I have 5 megs of 16-bit and 1/2 meg of 32-bit on my Amiga.)

5) Game developers of the CD^32 have a choice of utilizing either pure CD sound (read off the CD rom as the game plays with virtually no CPU slowdown) -- OR -- using the Amiga's already impressive sound chip (Paula) which by itself offers near CD quality sound.

Jaguars are stuck (at least until September 94) with chip-music.

6) The Jaguar's custom chips are slaved to its comparably slow 68000. The custom chips in the Amiga CD^32 run totally independantly of the CPU. For example, if an Amiga CD^32 wants to play a 400K digital sample out of memory, its 68020 merely tells the Paula chip "Theres a sample over here at this memory address. Play it..See you later!" The CD^32's 68020 CPU can then go on do to whatever it wishes.

7) There number of titles available -NOW- for the CD^32 outnumbers the total number of Jaguar titles available by a factor of 10.

There are currently 2x as many titles available for the CD^32 *RIGHT NOW* than Atari even EXPECTS to have by the end of 1994! (Read the news transcript of Sam Tramiel's interview off NewsBytes.. He only expects 24 by the end of 1994.)

>>Nowadays it seems that the only thing the Jaguar has over the CD^32 is
>>marketing hype. Atari may have dug its down grave by claiming such
>>absurdities as "850 million Gouraud-shaded pixels per second" and then
>>a week later releasing a game like Cybermorph with barely more PEP in it
>>than Starfox for the SNES..

Too bad Atari already sent off its first 50,000 UNITS with severe interference problems. Nice quality control. Can you say, "Rush Job"? I knew you could. Imagine all the lovely smiles on the faces of children who open their presents on Christmas morning, invite all their friends over to check out their new Jaguar, and discover the console is absolutely unplayable due to its horrible RF interference.

Merry Christmas, Atari.

50 million would still be a longshot in my book.. The fact is, I dont see any concerted effort by Atari to clear up the misunderstanding regarding the Jaguar's specs and stats.

What I see is a desparate company looking to fill it coffers using marketing hype, deceptive advertising, and saving the truth for later. "When its convienient."

Im not slamming the Jaguar. Its a fine machine, given the limitations it has to work within, and it deserves to succeed. Wether it will or not, is STILL totally up in the air, and leaning towards the "No" side.

Chris, my intent is to be always rational, except when being ironic.
If I made a mistake, I apologize and take it back, and I wellcome any
corrections.

I do know that ATARI indeed wanted an early November release though,
and I appreciate that you corrected me.

Atari moved their launch date from March 94 to September 94 to allow developers
time to create games for it. Kinda sucks, dosent it, considering that the Amiga
CD^32 will by then, have over a YEAR head start in the CD-games
race.

>

Commodore-Amiga has stated SEVERAL times, in public, in private seminars, and
in press briefings that their plant in the Phillipines, since mid July, has
been solely focused on creating Amiga CD^32 game consoles. They are doing so at
a rate of 22,000 units per week. Its now the end of November.. 22,000 units
per week, created from mid July--->Present Day. You do the math.
Commodore has sold 500,000 CD^32 units thus far.

Commodore representatives have said just last week they they are STILL having
problems meeting the demand for the unit in the UK and Europe.

I stand corrected. I still think that the time for True COlor modes is NOW
and not RSN. In which case, talking computers (a funny thing in a computers
advocacy group, I know) then Commodore is still the only manufacturer to not
supply True Color modes as standard. Despite the debate over HAM8 vs 16 bit
color, (and having not seen HAM8 myself) I prefer 16 bit. I think it was you
that said "for painters, drawing in 16 bit True color is better than HAM8"
Well, do you think more home vomputer buyers are going to be doodling in a
paint program or doing HAM8 animations?

Quit spreading lie, Powie. The interference problems were
only with the first 5,000 Jags. And, of course, the buyers
of these systems are going to get a free fix from Atari.
Get your facts straight. Telling a ficticious story of
little Bobby bawling on Christmas morning because his
new Jaguar doesn't work is simply idiotic.

>or had the wrong key switches/flags toggled?

Actually, I've gotten into the habit (with important documents) to hit Control S before anything like print or quit. Saves me in case of crashing, and will usually cancel any annoying dialogs because there aren't changes to save. Usually I only get the dialog with things I WANT to throw away. But I don't admit to being an average user.

>If Atari's operating system recommends "if a user is stupid enough
>to quit, then they should lose their work", I can see why there's
>so few Ataris out there ;-) Perhaps link all unknown commands from
>the shell to uncondtional format too, "because if they so stupid
>not know the command, they shouldn't be using a computer".

I don't know what the official reccomendations are... haven't looked it up yet, but I think they agree with many of the Mac ones, or maybe with "Cancel" being the default. (unfortunately the standard has not aaplied itself fully yet) I was just saying what _I_ would prefer for me, not what Atari or any manufacturer should implement as the standard, nor what IO would program as a developer.

False.

>3) The CD^32 has a 68020 CPU that offers roughly 4.5x as much horsepower as
> the Jaguar's 68000 CPU. And again, what good is the Jaguar's supposed
> "64-bit bus" if its only handling 16-bits worth of traffic? What good are
> 64-bit RISC GPU's if theyre only being told what to do by a slow 16-bit
> CPU such as the 68000 found in the Jaguar?

True to some extent. But the fact that the 68000 is a 16-bit processor
is not really a problem in the Jaguar. In the raw processing power department,
the Jaguar wins over the CD^32.

>4) The CD^32 has a 32-bit access path to its 2 megabytes of RAM. 16-bit CPU's
> like the Jaguar's 68000 are incapable direct access to 32-bit memory.

Again, not a problem since the bandwidth-intensive tasks will be carried
out by the 64-bit chips.

>5) Game developers of the CD^32 have a choice of utilizing either pure CD
> sound (read off the CD rom as the game plays with virtually no CPU
> slowdown) -- OR -- using the Amiga's already impressive sound chip (Paula)
> which by itself offers near CD quality sound.

Paula does not offer near CD quality sound. It offers very good sound, but
without using the processor (with which you can get 14-bit 44.1kHz+ sound),
you're stuck with four-channel 8-bit sound at 28kHz. I don't think this is
a problem though. If you use good equipment to capture and manipulate sounds,
8-bit sound is perfectly adequate.

> Jaguars are stuck (at least until September 94) with chip-music.

The Jaguar, while not being able to store a whole lot of sampled sound
on cartridges, has the advantage of having a DSP to generate and manipulate
sound. While it will take a while for programmers to learn how to do this
to get atmospheric sounds, it will be worthwhile.

>6) The Jaguar's custom chips are slaved to its comparably slow 68000. The
> custom chips in the Amiga CD^32 run totally independantly of the CPU.
> For example, if an Amiga CD^32 wants to play a 400K digital sample out of
> memory, its 68020 merely tells the Paula chip "Theres a sample over here

> at this memory address. Play it..See you later!" The CD^32's 68020 CPU
> can then go on do to whatever it wishes.

The Jaguar works the same.

>7) There number of titles available -NOW- for the CD^32 outnumbers the total
> number of Jaguar titles available by a factor of 10.

Not too hard considering the Jaguar only has one game available.

> There are currently 2x as many titles available for the CD^32 *RIGHT
> NOW* than Atari even EXPECTS to have by the end of 1994! (Read the news
> transcript of Sam Tramiel's interview off NewsBytes.. He only expects 24 by

Your maths don't add up, 1 x 10 != 2 * 24.

Just face it: both machines are good, and there's little use in spouting
nonsense and falsehoods about whatever system you don't own.

Just for the record, Microcosm isn't CD32-specific. It is being released
on PC CD-ROM, CD-I, CD32, and probably also SegaCD.

Oh, please, it's a third-party RF switch, being replaced for free. And did you
make up the 80% number all by yourself, or did someone help you?

>Want a list of superior aspects of the CD^32 versus the Jaguar? Ok.

Thank you for responding. Now I can show you your ignorance.

>1) We already have double-speed multisession CD-Roms in EVERY CD^32 unit.
> Atari has set the date for its CD-Rom to be shipped in September of 1994.
> And even (when/if) Atari ships their CD-Rom attachment, still only a
> fraction of Jaguar owners will buy them. Meanwhile, all CD^32 users have
> them already, today, now.

Whoopee. Who buys the CD has nothing to do with the technology of the system.
You have a CD, we will have a CD. Can you play CDs AND carts? No? Do you hear
me saying that that's an advantage for the Jaguar? No, because it's a stupid
argument, as is yours.

>2) The CD^32 has higher color capabilities at higher resolutions than the
> Jaguar.

Sorry, you're wrong. Apparently the CD32 can support a higher resolution
(which brings it to its knees), but the Jaguar has 16.7 million colors in
its highest resolution, which is 720x576, which is 414,720 colors if each
pixel was a different color. That's more than CD32.

>3) The CD^32 has a 68020 CPU that offers roughly 4.5x as much horsepower as
> the Jaguar's 68000 CPU. And again, what good is the Jaguar's supposed
> "64-bit bus" if its only handling 16-bits worth of traffic? What good are
> 64-bit RISC GPU's if theyre only being told what to do by a slow 16-bit
> CPU such as the 68000 found in the Jaguar?

You're dense. The 68000 in the Jaguar has very little to do. It gets to keep your score, maybe, and how many ships you have left. There are plenty of chips in the Jaguar that do all the real work. 64-bit RISC, on a 64-bit bus. And, as developers and posted, one can split up the work amongst any of the chips, and can even use the 64-bit RISC processor in Tom as the main processor.

>
>4) The CD^32 has a 32-bit access path to its 2 megabytes of RAM. 16-bit CPU's
> like the Jaguar's 68000 are incapable direct access to 32-bit memory. As

> to 16-bit memory. (I have 5 megs of 16-bit and 1/2 meg of 32-bit on my
> Amiga.)

Again, you're dreaming. Access to the 64 BIT MEMORY is through the Tom chip, through a 64-bit bus. Educate yourself before posting this drivel.

>5) Game developers of the CD^32 have a choice of utilizing either pure CD
> sound (read off the CD rom as the game plays with virtually no CPU
> slowdown) -- OR -- using the Amiga's already impressive sound chip (Paula)
> which by itself offers near CD quality sound.

Yeah, what, 8-bit? Real impressive.

> Jaguars are stuck (at least until September 94) with chip-music.

Yeah, real bummer, 32-bit sound chip at 200 kHz...

>6) The Jaguar's custom chips are slaved to its comparably slow 68000. The
> custom chips in the Amiga CD^32 run totally independantly of the CPU.

Sorry, Jaguar's chips are NOT slaved to the 68000. Try again.

>7) There number of titles available -NOW- for the CD^32 outnumbers the total
> number of Jaguar titles available by a factor of 10.

Whoopee, there are hundreds of Nintendo games. What does that prove? The Jaguar just came out. Don't bother to look at the quality of the games, that isn't important, right?

> There are currently 2x as many titles available for the CD^32 *RIGHT
> NOW* than Atari even EXPECTS to have by the end of 1994! (Read the news
> transcript of Sam Tramiel's interview off NewsBytes.. He only expects 24 by
> the end of 1994.)

Yes, written in-house. That does not include third-party. You are dense.

Tom

Again, you show that you know nothing. It was the 1st shipment of 2000 units
only, and there is nothing "severe" about it. The interference is barely
noticeable on my system, and I am getting along just fine. Atari is shipping

replacement RF switches to all owners for free.

Tom

Yes, which is good for stills and pre-stored animations .. but as soon as
you're going to animate HAM8 in realtime, moving things around, you'll have to
do those algorithms in REAL-TIME ..

Actually I've heard this also ... It's ofcourse the right thing to do
(releasing the CD-ROM with no games ready is not very smart .... although C=
released the CD32 without any real CD games .. :-))

Hopefully they won't wait, the unit itself has been ready since several months

The point is that HAM8 is not 18-bit. It cannot exactly represent an
arbitrary 18-bit image without some distortion (for exactly the same
reasons that it won't do this for a 24-bit image). Sure, many (most?)
images will look just fine in HAM8 - that was never the issue. Read the
subject title of this thread again. The claim was that HAM8 was the same
as 24 bit/pixel for some resolutions. The only resolution I can think of
for which this is true is one that only has 64 pixels.

>
> I thought we were discussing 24-bit graphics here?

I wasn't the one that brought up 16-bit graphics. :-) Actually, all I
was trying to illustrate is that not only can't HAM8 support the original
claim of being able to exactly represent 24-bit images, it can't represent
16-bit images either. The point was simply that while HAM8 is certainly a
useful display mode for a number of purposes, it does not exactly

represent (as was claimed) the original image. But then neither does any
other lossy compression means.

Better than the 24-bit image? (Which is what I was referring to.)

## 3262. Re: Jaguar is the next Edsel

Newsgroup: comp.sys.atari.advocacy
Date: 1993-12-01 01:09:26 UTC
From: cs151ns@lamar.ColoState.EDU
Message-ID: <Dec01.010926.32333@yuma.ACNS.ColoState.EDU>
Source record: 20042

questions here:

first, i saw some posts saying that half a million CD32's have
been sold ?! I find this a little hard to believe. Are you
sure that is just not shipments to DEALERS?

And does anyone know how many Falcons have been sold? I was
talking to my local Atari dealer today, and he guessed around
ten to twenty thousand. Any hard figures?

Jon Armstrong

)>The figure of 850 million pixels per second probably refers to the
)>Jaguar's peak blitting speed.
)>
)>--Gerry
)>
)
)
)50 million would still be a longshot in my book.. The fact is, I dont see any
)concerted effort by Atari to clear up the misunderstanding regarding the
)Jaguar's specs and stats.

What leads you to doubt this figure? The fact that the CD-32 can't do it?

)
)What I see is a desparate company looking to fill it coffers using marketing
)hype, deceptive advertising, and saving the truth for later. "When its
)convienient."
)

It's using the same hype all the other game companies are using, for
once Atari is in a crowd. At least Atari isn't saying that they have
"super duper blast processing" or "incredi-fx chip" or anything - they
actually give some numbers (which you do have to process carefully,
I'll admit).

)Im not slamming the Jaguar. Its a fine machine, given the limitations it has to
)work within, and it deserves to succeed. Wether it will or not, is STILL
)totally up in the air, and leaning towards the "No" side.
)

I wouldn't say it is totally up in the air. They now have a number of
developers, machines are selling well it seems, and they are so far
delivering on thier promises - quite a feat for Atari!!

)>>
)>>On the other hand, on the Amiga CD^32,such a task is not only possible, but
)I'd
)>
)>>even go so far as to say -very WELL EQUIPPED- to perform suck tasks due to
)its
)>>pre-existing CD-Rom.
)>
)>With the Jaguar CD, this point is quite moot. (And I won't won't even touch
)>the comment about the CD32 performing "suck tasks" B-)
)
)The Jaguar CD, Atari has said, will be released in Semptember 1994, to build
)time for developers to make games for it. Atari will have already lost by
)then..Too little, too late.
)

But the Jaguar will have been out all that time garnering support.
And because of it's fairly cheap price, it will sell a lot of units.

)
)
)>
)>>The numbers of Jaguar users alone is still quite small--the number of Jaguar
)>>users in the future who will buy the supposed CD-Rom addon when/if it is
)>>announced will still then only be a fraction of that small group--it wouldnt
)>>warrant a serious effort among game developers to create titles for an
)obscure
)>>machine with an even more obscure attachment.
)>
)>Conjecture and bullshit. Of course the number of Jag owners is small, it just
)>came out a week ago, dimwit!

)
)
)Reread what I said, and dont call me a dimwit. The number of Jaguar units is
)already guaranteed to be very small in Europe/UK due to the Amiga CD^32's
)presence, and the boost given by 4.5 million other Amiga users overseas. Europe
)is ours. Stateside, the number of Jagauar units will be small, and the number
)of Jaguar units equipped with this CDROM to supposedly be released in SEPTEMBER
)of 1994, will be even smaller--Game developers will have long since grown tired
)of waiting for Atari, and will switch to other more profitable platforms rather
)than trying to continue their work for a machine that only offers promises, not
)actual physical products.

You're assuming that all game developrs will only develop for CD-ROm,
which is just completely false.

)
)Also, considering that when the CD^32 is announced over here, Stateside, in
)January.. it will STILL be another, what, >>9<< months until Atari releases its
)CD attachment in September 94! To make matters worse, EUROPEAN Amiga CD^32
)users will have CD-Roms for MORE THAN AN ENTIRE YEAR before Atari rolls out
)their CD peripheral.
)
)

So the'll have a lot more old A1200 games to play than we will. Too
bad for you!! In the meantime, Jag carts will be coming out - you
treat the Jaguar as if NO GAMES at all are coming out!!!!!!!

)
)
)>
)>>Amiga CD^32 users have it lucky--they already have all the equiptment topull
)>>it off, they already have huge numbers (in upwards of half a MILLION CD^32
)>>units in the UK/Europe..Not to mention 4 million Amiga users already!), and
)>>they already have FMV capability.
)>
)>Watch the jaguar catch up very quickly. Don't stop the race as soon as the
)>opponent enters.
)>
)
)The race will be already over by the time Atari shows up at the starting line,
)im afraid. Its a shame to see a good product go under due to slow garnering of
)support..
)

Atari has already left the starting line, the CD-32 is still in the
locker room trying to remember how to tie its shoelaces.

)>>Dont get me wrong, however--I like the Jaguar. I also like the CD^32. Each
)>>machine has its share of technical superiority over the other, in certain
)>>areas-- However, its in my opinion that the Jaguar is entering the "fight"
)ill

)>>equipped, undersupported, and overrated.
)>
)>Please. Tell me how CD32 is technically superior in any aspect. And please
)>don't use the CD, the Jaguar will have it as an option. If Atari scraps the
)>CD, than you can use it in your argument.
)
)First of all, at this point, I think youde be better off saying that Atari
)---MIGHT--- offer the CD as an option. Atari may very well go bankrupt if
)the Jaguar flops. Debuting the machine and selling it to the public in where
)80% of the Jaguars have display interference problems dosent make for a very
)good first impression, now, does it?
)

Then let's also say the CD-32 MIGHT reach the states - Commodore is
more likley to go bankrupt than Atari at this point.

)
)Want a list of superior aspects of the CD^32 versus the Jaguar? Ok.
)
)1) We already have double-speed multisession CD-Roms in EVERY CD^32 unit.
) Atari has set the date for its CD-Rom to be shipped in September of 1994.
) And even (when/if) Atari ships their CD-Rom attachment, still only a
) fraction of Jaguar owners will buy them. Meanwhile, all CD^32 users have
) them already, today, now.
)

Sort of an advantage.

)2) The CD^32 has higher color capabilities at higher resolutions than the
) Jaguar.
)

Nope. The Jaguar has real 24-bit color, plus trasparancy etc. The
Jaguar has a maximum resolution that the TV can be driven to, so the
Amigas rezes beyond are useless.

)3) The CD^32 has a 68020 CPU that offers roughly 4.5x as much horsepower as
) the Jaguar's 68000 CPU. And again, what good is the Jaguar's supposed
) "64-bit bus" if its only handling 16-bits worth of traffic? What good are
) 64-bit RISC GPU's if theyre only being told what to do by a slow 16-bit
) CPU such as the 68000 found in the Jaguar?
)

What good are any graphics at all on the CD-32 if it has to go through
the cripplingly slow EC68020? The Jaguar wins here.

)4) The CD^32 has a 32-bit access path to its 2 megabytes of RAM. 16-bit CPU's
) like the Jaguar's 68000 are incapable direct access to 32-bit memory. As
) a result, memory access is much slower, because the Jaguar is forced to
) use 16-bit memory..and having a slower CPU than the Amiga CD^32 makes
) matters worse..And believe me, when I tell you theres a massive speed
) increase between 32-bit RAM access and 16-bit ram access, I am NOT lying.
) From speed tests ive done on my own Amiga system, I can tell you that

) memory access going from/to 32-bit memory is roughly 10x faster than going
) to 16-bit memory. (I have 5 megs of 16-bit and 1/2 meg of 32-bit on my
) Amiga.)
)

You are just beyond belief. Graphics have to travel down your pitiful
32-bit bus, while the swim freely in the Jaguars 64-bit bus.

You are saying that memory access is 10x faster from 16-bit RAM to
32-bit RAM? HA HA HA HA HA HA HA HA HA HA HA HA HA HA HA HA HA HA HA
HA HA HA HA HA!!!!!!

I won't even bother to explain why you are wrong here, I am laughing
to hard at your superhuman level of ignorance to bother. I'll just
chalk it up to the same part of your brain that produces the "flat
gourad shading" illusions...

)5) Game developers of the CD^32 have a choice of utilizing either pure CD
) sound (read off the CD rom as the game plays with virtually no CPU
) slowdown) -- OR -- using the Amiga's already impressive sound chip (Paula)
) which by itself offers near CD quality sound.
)
) Jaguars are stuck (at least until September 94) with chip-music.

Let me re-phrase the above - Amigas are forced to use the CD for sound
if they want any, otherwise Paula has to belch out some 8-bit noise.

The Jaguar is stuck with 16-bit sound from the start, with or without CD.

)
)6) The Jaguar's custom chips are slaved to its comparably slow 68000. The
) custom chips in the Amiga CD^32 run totally independantly of the CPU.
) For example, if an Amiga CD^32 wants to play a 400K digital sample out of
) memory, its 68020 merely tells the Paula chip "Theres a sample over here
) at this memory address. Play it..See you later!" The CD^32's 68020 CPU
) can then go on do to whatever it wishes.
)

Claytons brain seems to be slaved to a ZX-81 - in slow mode!!

The Jaguar can just tell Jerry "Hey - there's a sample over here -
play it". The TOM renders 10 billion gourad shaded polygons while the
68000 spends its whole time calculating the players score.

)
)7) There number of titles available -NOW- for the CD^32 outnumbers the total
) number of Jaguar titles available by a factor of 10.
)
) There are currently 2x as many titles available for the CD^32 *RIGHT
) NOW* than Atari even EXPECTS to have by the end of 1994! (Read the news
) transcript of Sam Tramiel's interview off NewsBytes.. He only expects 24 by
) the end of 1994.)
)

From Atari - you forgot to include any 3rd party titles.

I don't care how many lame-o A500 ports you get for your CD-32.

)
)
)
)>>Nowadays it seems that the only thing the Jaguar has over the CD^32 is
)>>marketing hype. Atari may have dug its down grave by claiming such
)>>absurdities as "850 million Gouraud-shaded pixels per second" and then
)>>a week later releasing a game like Cybermorph with barely more PEP in it
)>>than Starfox for the SNES..
)

I see you are actually stupid enough to think the above is true.
Let me just reiterate that Cybermorph is far beyond Starfox.

heh... yup.. and I think what you will be getting with the CD rom is a lot of
digitized movie sequences. Which is fine if you like that sort of thing but
it sort of takes away from the gameplay if used extensively. I would rather
be blasting away then watching a digitized movie of someone telling me how
to play the game.. <grin>

:#In article <CH4tvJ.yD@news.Hawaii.Edu> jimmy@Hawaii.Edu (Jimmy Chan) writes:

<Stuff deleted since we've come to some agreement>

:#)Developers may have it but, which do you think they will bring out software
:#)for? If the CD isn't in the market then it's out of the development phase
:#)til a fair portion of the user base has it.

:#But they need games to release the unit, so someone somewhere is
:#working on it!!

I don't think any developer is actively working on the Jaguar's CD stuff right now. They probably have plans for CD development but until a CD unit comes out, why put money into developing for a CD when there isn't one as yet. Since the Jaguar is new and unproven as yet, the developer's will be spending their money on developing catridge based stuff and then waiting to see how the CD units are going before plunking down money for CD development. Remember CD development is expensive for a small base while catridge development is cheaper for a small base. Until the base becomes larger CDs won't be worthwhile.

:#I think a lot will depend on how soon the initial shipment sells. As
:#far as I ccan tell, it's been moving pretty well (I think almost all
:#of the initial units were preordered!!).

Yes, that's why I'll wait a few months before making my decision on which console to get because the market will have stabilized and prices will have dropped. There'll be a price war going on between the different consoles. I wait til the price war...8-).

:#)Actually same goes for the CD32. Just attach a drive.

:#Well, perhaps, but a system with a CD as the primary media will have
:#fairly large games that would be painful to use without a HD. I guess
:#you could still use one disk Amiga games, but where's the fun in that?

Note, I said drive. Didn't mention about what type of drive...8-). You could easily attach a controller with HD via expansion slot. Though, I've been wondering if the CDROM on the CD32 is attached via SCSI. If it is then it'll be even easier to attach a HD or any other SCSI device. Though I don't know for certain since none of the specs have included this.

:#)It a matter for the marketing people.

:#True, but the Jaguar has real marketing friendly numbers - "64-bit!!"
:#sure sounds good on TV, and the press just eats it up.

Yes, the press doesn't know the difference. I can think of a certain
poster in one of the newsgroup, who happens to be a columnist that doesn't
seem to really present information about computers very well, or he has a
very narrow mind.

:#)I've already replied once to this. I really haven't seen too much about
:#)software development of the Jaguar. I've seen some from people who don't
:#)have anything to do with software development but not really too much from
:#)actual developers. 3DO, I've seen a few postings from actual developers.

:#What I am really more interested in is a list of companies signed on
:#as developers for the CD-32. I keep hearing stuff like "half the
:#world population is now a CD-32 developer!!", but I'd like to see an
:#actual list.

Okay, this is from this month's AmigaWorld:

Developer Games
Gremlin Graphics bundling all three of its Lotus racing games
Zool (w/ 3-D shots, CD soundtrack)
Renegade Sensible Soccer (w/ CDTV version also)
Uridium 2 (sideways shooter)
The Chaos Engine
System 3 reissue Ninja series (Ninja Remix, Last Ninjas II
& III)
Millennium Diggers (strategy/arcade)
James Pond II: Robocod
Operation Starfi5h (not a typo) (massive 3rd
episode to James Pond line)
Morph (arcade/puzzle)
Flair Oscar (platform game)
Surf Ninjas (beat 'em up)
Genesis (graphic adventure)
1869 (19th century trading)
Whale's Journey (futuristic RPG)
Mindscape International D/Generation (isometric puzzle game)
two-pack TV Sports (baseball and boxing games)
Alfred Chicken (silly 11-level platform game)
Liberation (CD32-only) (follow-up to Captive w/
4096 computer created plots & more than 36,000
possible locations in each of its cities. Plural)
Mirage Rise of the Robots (more like a movie than a game)
Ocean (UK label) Ryder Cup Golf
Sleepwalker
Jurassic Park
T.F.X (DID's)
Inferno (DID's)
Psygnosis Microcosm (first person shoot-'em up)
Dracula
Storm The Lawnmower Man (arcade sequences in 3-D
environment, CDTV, CD32 version is a possibility)
Supervision Donk! (platformer w/ a samurai duck)

System 3 Putty 2 (arcade/puzzle game, same mold as Morph)
Team 17 Alien Breed 2
Body Blows
Body Blows Galactic
X2 (follow-up to Project-X may be CD32 only)
Thalion Ambermoon (sequel to Amberstar) (massive
free-scrolling role-playing game)
21st Century Pinball Fantasies (256 color)
US Gold Flashback
Virgin Dune (w/ speech and enhancements to travel scenes)
(this hasn't been formally announced but rumored)
Bullfrog Syndicate (w/ new features, rotatable view and
interior cutaways specific to CD)
Theme Park (amusement-park construction set)
Creation (new underwater first-person God sim)
some kind of flight simulator (using a magic carpet)
Grandslam Nick Faldo's Golf (256 colors, with voices)
England World Cup '94 (soccer game)
International Computer
Entertainment (ICE) game based on Akira, Japanese cartoon (involves
motorcycle racing and "plenty of blood and gore")
Krisalis Soccer Kid (w/ improved animation)
Sabre Team (w/ extra levels)
Microprose No committment as yet, but is keeping an eye on
things. UK division might jump in.
Jim Sachs Defender of the Crown II (sequel to Defender of the
Crown) (occupies 150 MB on CD)

Some of these have already been released by now and new ones are available.
I just copied whatever was in the AmigaWorld column. Which as everyone
knows, magazine columns are 2-3 months behind the times...8-).
This doesn't mean these are all the developers but only what I've got from
AmigaWorld. Don't have the European game magazines on hand. From a C=
employee, there are already 38+ games released for CD32. I have his
posting saved if anyone wants confirmation...8-).

:#I myself don't hate the CD-32, although some of my replies to the One
:#Named Clay may have made it look that way. I just think it is less
:#powerful that the 3DO or Jaguar, and it is too much of a computer
:#wannabe to suit me (shades of Coleco adam).

Yes, it is less powerful than the 3DO and Jaguar but, as has been proven
before, it's not the power of the hardware but how much software it has
available, number of users and price. I've said this before. VHS vs.
Beta, Clones vs. everybody else...(just had to put that in), SEGA or
Nintendo vs. Neo-Geo, NeXT vs. not sure here.

Btw, Clay doesn't speak for all Amiga users... same as certain people don't
speak for all Atari users and so on.

:#It is refreshing to see a reasonable post, though. Me and my blood
:#pressure thank you.

We are all adults, I hope, and should be able to discuss things in a rational and unemotional forum, though advocacy is a far cry from being rational and unemotional but one can try.

I still don't know which console I'll purchase but, the CD32 looks good to me so far. The Jaguar, is probably the next candidate though if the CDROM isn't available by the time I'm ready then it's the 3DO.

:#video fdor about $200 (US), I'd say the FMV cart had better be less.
:#I personally think this whole CD-ROM movie thing is silly, because
:#laserdisk is better and you can't record on a CD-ROM. That's why I'm
:#less than excited about these FMV carts for any system... I can get a
:#really good VCR for less than the price of a FMV cart and get a lot
:#more functionalliy. I think (hope) the whole CD-ROM FMV thing flops.
:#Can anyone offer a reason why the FMV cart stuff is worth buying at
:#any price?

You can get a cheap laserdisc for about $200 but, it usually doesn't offer the extras and there are sometimes problems with different laserdisc formats. Extras are like not having to flip the laserdiscs, random searches, full remotes, etc....8-). Sorry, I'm into laserdiscs.

Well, that being said, it's true the FMV stuff isn't really great but it's an extra (optional) for those that want it. You don't want it don't buy it. I myself don't care for FMV, I have a laserdisc collection. I won't be buying it for any of the game consoles but, it's an extra selling point. Same goes for PhotoCD, being an extra selling point that is, don't know if I'll need PhotoCD capability as yet, it has possibilities I've recently found out.

I think IBM or was it blockbuster, oh well, in a CNN clip that there's about 3000 video titles available on CDs.

> The Jaguar can just tell Jerry "Hey - there's a sample over here -
> play it". The TOM renders 10 billion gourad shaded polygons while the
> 68000 spends its whole time calculating the players score.
Do you know how much time TOM needs to render those 10 billion polygons. I know
10 billion is a somehow high figuere :-) Nevertheless, how long would it take
TOM to do it?
I guess the CD32 will need at least 115 days (!!!) to do that. (assuming that
1 billion = 1.000.000.000).
How many days for the Jaguar?

Georges.

In article <cdonley.2q7h@amiganet.xnet.com> cdonley@amiganet.xnet.com (Clayton Donley) writes:
>2) The CD^32 has higher color capabilities at higher resolutions than the
> Jaguar.

Wrong, or at least non-valid. All CD^32 games will run in 352*256*256 colours, while Jaguar games will run in 24bit colours in the same resolution.
This is due to the bus limitaton of the AGA chipset, with a maximum capability of 19-20 megs/second useable for graphics and full bus contention at 25-26 megs/second. Thus, if you have 640*480*256 colours, there are only 5 megs/second left for the actual gameplay, not enough for games like Uridium 2.

>3) The CD^32 has a 68020 CPU that offers roughly 4.5x as much horsepower as

> CPU such as the 68000 found in the Jaguar?

You have still not had a look at the block diagram of the Jaguar, have you?
The 68000 CPU in the Jaguar is supported by much more powerful custom chips than the 68EC020 in the CD^32 (remember when Atari folks claimed the ST was better than the Amiga because of the faster processor (8 vs. 7.16 MHz)?)
And the CD^32 is 2.8 times faster than the A500, according to Sysinfo.
The Jaguar has a processor with 1.8 times the speed of the A500s. How comes that 2.8/1.8 is 4.5 for you?

>4) The CD^32 has a 32-bit access path to its 2 megabytes of RAM. 16-bit CPU's
> like the Jaguar's 68000 are incapable direct access to 32-bit memory. As

> to 16-bit memory. (I have 5 megs of 16-bit and 1/2 meg of 32-bit on my
> Amiga.)

The 68000 in the Jaguar DOES NOT access the RAM directly. The custom chips DO access the RAM directly. And - speaking of games - most of the work is done by the custom chips in BOTH machines, with the AGA chipset being 16 bit and the Jag chipset being 64 bit organized. What do YOU think is faster?
I wouldn't run a C compiler on a Jaguar, you know?

>5) Game developers of the CD^32 have a choice of utilizing either pure CD
> sound (read off the CD rom as the game plays with virtually no CPU
> slowdown) -- OR -- using the Amiga's already impressive sound chip (Paula)

> which by itself offers near CD quality sound.

The PAULA chip does NOT offer 'near CD quality sound', unless you switch both machines off, then the sound is equal. PAULA offers 8 bit, 26 MHz (? not sure here) stereo sound with almost no processor contention. CDs offer 16 bit, 44.1 kHz stereo sound. This is quite a difference.

> Jaguars are stuck (at least until September 94) with chip-music.

The Jaguar sound chip offers CD quality sound, you forgot to mention.

>6) The Jaguar's custom chips are slaved to its comparably slow 68000. The
> custom chips in the Amiga CD^32 run totally independantly of the CPU.

> at this memory address. Play it..See you later!" The CD^32's 68020 CPU
> can then go on do to whatever it wishes.

So the Amiga custom chips don't get commands by the CPU? Strange, I always thought there was some game logic required for CD^32 games...
DMA capabilities for sound are implemented in any Atari since the STE, I doubt the Jaguar has no DMA sound. And the Jaguar's 68000 has less to do than the 68EC020 in the CD^32, don't forget this. If the processor load is THAT low, a slow one might fully suffice. I was told that in 'Crescent Galaxy' there are creatures filling half the screen with NO slowdown. Quite impressive for a 'slow CPU'.

In <cdonley.2q7h@amiganet.xnet.com> cdonley@amiganet.xnet.com (Clayton Donley) writes:

In relation to the new Jaguar computer, I'd like to add my oppinion to the debate.

I have noticed that the main opposition/suspicion comes from the Amiga groups. This is not a suprise. Most Amiga users have had an inflated ego, as well as a superiority complex since the days of the ST and Amiga. They dislike Atari users, and see anything from Atari as utter shit, not worth their precious attention. This is not true of all Amiga users, but I have noticed over the last three to four years, an arogance in their stance and views.

From what I have seen with my own eyes, and witnessed from video and presentations, and having good knowledge on computers and their architecture (I am studing, in my last year, Computer Science, Trinity College Dublin), I am suere of the following.

* The Jaguar is a powerful machine. Many developers have stated this, and the videos of games in action on the machine are ample evidence.

* The Jaguar incorporates a 64-bit bus. I have seen the machine circuit board, and can confiently state this to be a fact.

* The Jaguar has two VLSI chips, sitting on this 64-bit bus. They have the functionality of multiple graghic chips. I cannot be sure what exactly they contain, but I am sure that they include 64-bit, as well as 32-bit dedicated processors. The fact that they communicate with memory over a 64-bit bus is significant.

* The Jaguar has a 16-MHz 68000 processor. I have heard that the processor actually runs at hlaf the system clock, so it would run at about 13-14Mhz. This is great news for programmers, as the chip has a long history and is well tested.

Most people must admit that the machine is interesting. That is the reason I read this news group. I think that this is a bold effort by Atari, who have had a shady past when it comes to announcing new products. But as far as I'm concerned, Atari are giving this theri best shot, and are willing to finance it, so no complaints from me.

I have heard CD32 users ( or wanna be's) talk of it's technical superiority, and then of it's better popularity amoung developers. The latter may be true, but I would suspect this is from habbit, and will soon change. This is only true in the UK, however.

Here is an extract from one such Amiag user.

>Reread what I said, and dont call me a dimwit. The number of Jaguar units is
>already guaranteed to be very small in Europe/UK due to the Amiga CD^32's
>presence, and the boost given by 4.5 million other Amiga users overseas. Europe

>is ours. Stateside, the number of Jagauar units will be small, and the number
>of Jaguar units equipped with this CDROM to supposedly be released in SEPTEMBER
>of 1994, will be even smaller--Game developers will have long since grown tired
>of waiting for Atari, and will switch to other more profitable platforms rather
>than trying to continue their work for a machine that only offers promises, not
>actual physical products.

>Also, considering that when the CD^32 is announced over here, Stateside, in
>January.. it will STILL be another, what, >>9<< months until Atari releases its
>CD attachment in September 94! To make matters worse, EUROPEAN Amiga CD^32
>users will have CD-Roms for MORE THAN AN ENTIRE YEAR before Atari rolls out
>their CD peripheral.

FACT: The CD32 is a less powerful computer/console then the Jaguar.

People, like the above are extremely narrow minded. Thisd individual will
NEVER be convinced from his truth. I wish that there was less of this shouting
, and more productive discussion on the machines, including the CD32. `

>Want a list of superior aspects of the CD^32 versus the Jaguar? Ok.

>1) We already have double-speed multisession CD-Roms in EVERY CD^32 unit.
> Atari has set the date for its CD-Rom to be shipped in September of 1994.
> And even (when/if) Atari ships their CD-Rom attachment, still only a
> fraction of Jaguar owners will buy them. Meanwhile, all CD^32 users have
> them already, today, now.
You do not need a CD to have a playable, enjoyable game. A Cartridge can acommadate
such a game easily. MegaBytes do not make a good game., The best games ever were
the smallert. Look at Elite II. Of course, a CD will allow more freedom, and it is
the logical step to take, but dont underestimate the capacity of a cartridge.`

>2) The CD^32 has higher color capabilities at higher resolutions than the
> Jaguar.
Does the Jaguar not have 32-bit colour values? This 32-bits does not translate
to "32" bit colour, but incorporates transparency as well as 24-bit colour.
The CD-32 uses Hold and Modify, a clever but less accurate way of representing
24-bit colour. I disagree with you.`

>3) The CD^32 has a 68020 CPU that offers roughly 4.5x as much horsepower as
> the Jaguar's 68000 CPU. And again, what good is the Jaguar's supposed

> 64-bit RISC GPU's if theyre only being told what to do by a slow 16-bit
> CPU such as the 68000 found in the Jaguar?
I would love to get my hands on the bus usage of the 68000. It runs at half
the speed of the 64-bit graphic processors, and is only used for control.
FACT: Most bus usage will go to graphic work, not the 68000.
I'm sure Atari have some sort of multiplexing to get a higher throughput
for the 68000.`

>4) The CD^32 has a 32-bit access path to its 2 megabytes of RAM. 16-bit CPU's
> like the Jaguar's 68000 are incapable direct access to 32-bit memory. As

> Amiga.)
Rubbish. With good memory logic, the same speed can be obtained from 1-bit memories
interleaved, instead of 32-bit memory chips. This interleaving is what I suspect
is on the Jaguar. Your argument is very loose, and quite inaccurate.

>5) Game developers of the CD^32 have a choice of utilizing either pure CD
> sound (read off the CD rom as the game plays with virtually no CPU
> slowdown) -- OR -- using the Amiga's already impressive sound chip (Paula)
> which by itself offers near CD quality sound.

The Jaguar has an impressive sound system. I wont go into detail. There
is a DSP on the board.

>6) The Jaguar's custom chips are slaved to its comparably slow 68000. The
> custom chips in the Amiga CD^32 run totally independantly of the CPU.
> For example, if an Amiga CD^32 wants to play a 400K digital sample out of

> can then go on do to whatever it wishes.
This is highly inaccurate. The custom chips on the CD32 dont compare well
at all to those used on the 64-bit Jaguar.

>7) There number of titles available -NOW- for the CD^32 outnumbers the total
> number of Jaguar titles available by a factor of 10.
These titles are A1200 titles with knobs on. There are very few CD onlt Amiga
titles.

Open your minds.

(List of loads of developers and games)

Did you notice that only a few of those were using AGA graphics, and that the rest were A1200 games copied to a CD?

JC> AmigaWorld. Don't have the European game magazines on hand. From a C=
JC> employee, there are already 38+ games released for CD32. I have his
JC> posting saved if anyone wants confirmation...8-).

Not surprising .. kinda easy for developers to copy old games to CD ..

JC> Yes, it is less powerful than the 3DO and Jaguar but, as has been proven
JC> before, it's not the power of the hardware but how much software it has
JC> available, number of users and price. I've said this before. VHS vs.
JC> Beta, Clones vs. everybody else...(just had to put that in), SEGA or
JC> Nintendo vs. Neo-Geo, NeXT vs. not sure here.

Well, those were a lot closer in specs than the CD32/Jaguar .... (if you don't read Clayton Donkey's postings .. )

JC> I still don't know which console I'll purchase but, the CD32 looks good to
JC> me so far. The Jaguar, is probably the next candidate though if the CDROM
JC> isn't available by the time I'm ready then it's the 3DO.

Why is everybody raving about the CD-ROM? If the Jaguar can store almost 50Meg of graphics on a cartridge, the CD-ROM will only be used for the absolutely biggest adventures ... and really ... there's a market for other games too ..

Return to Zork (or whatever it's called) is already under developement for the JagCD.

|>

Bad analogy. And you can connect a 680x0 familly processor upto a 64 bit
memory architecture, a cute little PGA I programmeded at Lockheed did just
and the 68000s 16 bit bus worked just fine thank you.

|> Now on the other hand, lets say you have a 16bit (16 foot wide) sewer pipe.. It
|> cant handle the amount of water(data) a 32-bit pipe carries..
|>
|>
|> A 16-bit CPU can only address 16-bit memory, at maximum.. It can address 8 bit

|>
|> In otherwords, your Jaguar dosent have 64-bit memory, because if it did, there
|> would be no way for the CPU to access it!

Lets see if I enable the datapath the lower 16 bits of a 32 bit memory
array when address line A1 is inactive, and I enable the data path to
the upper 16 bits when address line A1 is active, then I can access all
thirty two bits of that memory array. Now if I use address lines A1 AND A2
I can create a simple decoder that can access a 64 bit memory array. And
because the 68000 uses the same memory timing as an 80386 (8 states per
access) there would be no wait states added because there is plenty of
time to decode and enable the correct buffers before the data will be
made available to/from the 68000.

!> :) Also, the fact that 64-bit-wide
|> RAM chips go for $450-$600 PER MEGABYTE in eletronics catalogs, may make you
|> scratch your head. The Jag has 16-bit memory.

So you don't buy 64 bit wide RAM chips, you buy enough 1 bit wide RAM
chips to make 64 bits, at $0.65(US) per mega bit, quanitity 1000
discount, to get 64 bit wide memory. (for the mathematically challenged
that's $41.60(US) per 8 mega BYTES )

|>
|>
|> >

|>
|> The Falcon has an 030(32-bit) chip that sits on a 16-bit bus. Its memory,
|> therefore, is 16-bit.
|>

Our survey says...

Wrong again.

The Falcons processor has a 32 bit wide data path but only a 16 bit data path
to memory. The Falcon video subsystem has a 32 bit data path to memory.

btw: The TT's 68030 has a 32 bit data path to memory, while the video
has a 64 bit data path to memory. Explain that one!

|>
|>
|> >
|> >(The datapath may be 16, but the memory is 32, and is used as such by all the

):#more functionalliy. I think (hope) the whole CD-ROM FMV thing flops.
):#Can anyone offer a reason why the FMV cart stuff is worth buying at
):#any price?
)
)You can get a cheap laserdisc for about $200 but, it usually doesn't offer
)the extras and there are sometimes problems with different laserdisc
)formats. Extras are like not having to flip the laserdiscs, random
)searches, full remotes, etc....8-). Sorry, I'm into laserdiscs.
)
)Well, that being said, it's true the FMV stuff isn't really great but it's
)an extra (optional) for those that want it. You don't want it don't buy
)it. I myself don't care for FMV, I have a laserdisc collection. I won't
)be buying it for any of the game consoles but, it's an extra selling point.
)Same goes for PhotoCD, being an extra selling point that is, don't know if
)I'll need PhotoCD capability as yet, it has possibilities I've recently
)found out.

The Photo CD stuff does interest me quite a bit as well - but that's
something that comes standard with all of the CD systems (say, does
anyone know if all of the CD systems handle multisession?).

The thing is that the FMV carts cost as much as a cheap LD player
(like you said, they aren't great at that price!) or a fairly nice
VCR. The problem is that the only feature you get is the ability to
play these CD-ROM movies - you can't record like a VCR, and the
picture quality is worse than LD. Given that most people buying a
$400+ game machine probably already have a VCR, I just can't imagine
not springing for a LD player instead of the FMV cart.

)
)I think IBM or was it blockbuster, oh well, in a CNN clip that there's about
)3000 video titles available on CDs.
)

Aren't there a lot more titles on laserdisk? I just view this FMV
cart stuff as an industry attempt to sell us something we really don't
need - and I have trouble imagining who will want it!!

# 3282. 3D0 vs jaguar

Newsgroup: comp.sys.atari.advocacy
Date: 1993-12-01 18:10:36 UTC
From: sjg@phlim.ph.kcl.ac.uk
Message-ID: <2dimms$m86@sol.ctr.columbia.edu>
Source record: 20062

I've just read the latest edition of PCW (January can you believe!)
and there's a comparitive mini-review (4 pages) of the 3D0 and the
Jaguar. The CD-32 isn't mentioned.

The basic conclusions of the article are:

o 3D0's software is not as playable as it ought to be. All
the stuff they had was "flawed in one way or another".
Although it must be said that this is early software.
o "Although the softwar eon the Jaguar looked much better
none of the products were ready in final form".
o "The 3D0 has the head start, but it won't take long for
the Jaguar to catch up"

Prices quoted are: 3D0 $699
Jag $249 \pounds 100

They seemed much more impressed with the Jaguar overall. This is
of course despite the Jaguar only being supplied with cartridge games
and the 3D0 being CD-based. I have to say that the graphics shots
of the Jaguar looked far more impressive than the 3D0.

ps: Stefan, thank God not all amiga-owners are like Clayhead :-)

Simon.

Atari was planning on releasing its CD unit in March--however, noticing the same problems Sega had with garnering support for it, they figured it would be best to develop a good stock of titles before releasing it. They bumped the release date up another 6 months, to September.

You know, the CD32 does have a 1MB Operating System. A few kilobytes
of that is dedicated to handling the NVRAM. It's basically a filesystem,
with a special menu for the user where you can delete files and so on.

OK, I shouldn't have chosen text as the example. Sharp edges and thin
lines in general cause fringing in JPEG.

>users will have CD-Roms for MORE THAN AN ENTIRE YEAR before Atari rolls out
>their CD peripheral.

Oh well I guess that's life. Just because they roll it out 9 months later
doesn't mean that Atari is going to die a painful death or that demons will
come out of the earth and the sky will turn back. Apparently they have sold
all their base units, and since they have already done that, there will be
an already established base for when the CD rom DOES come out. And there is
no reason to beleive that it won't come out either. Atari has made good on
their promises TO THE LETTER when it comes to the Jaguar. I see no reason
for them to balk on a promise when they are trying to prove that they can
deliver. It just doesn't make good business sense.

>The race will be already over by the time Atari shows up at the starting line,
>im afraid. Its a shame to see a good product go under due to slow garnering of
>support..

Wait and see before making any predictions. The last thing that you want
is to go around making those kinds of statements prematurely. It might
turn out just the opposite and then you'll have a lot of explaining to
do. I'm not writing off the CD32 yet, I think it'll liven things up a
bit and improve games on both machines. At any rate, since Atari is
entering such a huge market, even if they don't get a large share of it,
they can do naught but make money in some regard.

I'm pretty sure the Falcon, TT, ST and other "lame" computers that
Atari have made a GUI and can be "windows driven".

If you're talking about running Microsoft Windows, I'm not too sure
why you would want it to drive the Jaguar.

Hummm, I have never seen a computer 'driven' by windows, but perhaps this guy refers to MS-Windows. In that case, the verb should be 'possessed'. And 'real computers', what are 'real computers'? IMHO, a TS1000/ZX81 is a real computer also, and for professional applications, many small companies decided a MegaST w/ SM124 and hard disk fulfills their desires, at least over here in Germany. Newspapers chose the TT for their DTP and musicians like the STacy. Many chose the Amiga to do their video work. It depends on what you want and what you do with your computer, not if there is an 'intel inside' sticker on it.
And if I bought a PC compatible, it would neither have an intel processor nor would I run Windows on it (I prefer OS/2 for applications and Linux for professionality :-)).

: (List of loads of developers and games)

: Did you notice that only a few of those were using AGA graphics, and that the
: rest were A1200 games copied to a CD?

Why wouldn't they use AGA graphics? There are often AGA and ECS versions
of the same game released. How would you know if they don't use AGA
graphics?

A few of the titles are CD-only games, and some of them are also released
as PC CD-ROM games. Digital Intergration Designs (DID) make quite a
few good flight-sims on the PC and Amiga.

: Not surprising .. kinda easy for developers to copy old games to CD ..

They might be "old games", but quite a few have only have been recently
released on the PC and/or Amiga. I'd rather have a fun "old" game than
a crap new game. Quite a few of the games were fun on, and were improved
for the A1200/AGA. Others are kinda naff (Dracula on the PC comes to
mind).

[...]

: Why is everybody raving about the CD-ROM? If the Jaguar can store almost 50Meg
: of graphics on a cartridge, the CD-ROM will only be used for the absolutely
: biggest adventures ... and really ... there's a market for other games too ..

Because a lot of very good games are being released on CD-ROM. Rebel
Assault by LucasFilms is CD-ROM only, and a lot of adventure games
benefit from having speech and other extras stored on the ROM. You
can have interactive adventures where passages and conversation is
heard, instead of you reading a dialogue box.

: Return to Zork (or whatever it's called) is already under developement for the
: JagCD.

Perhpas we'll talk about it when it's released.

: )formats. Extras are like not having to flip the laserdiscs, random
: )searches, full remotes, etc....8-). Sorry, I'm into laserdiscs.
: )
: )Well, that being said, it's true the FMV stuff isn't really great but it's
: )an extra (optional) for those that want it. You don't want it don't buy
: )it. I myself don't care for FMV, I have a laserdisc collection. I won't
: )be buying it for any of the game consoles but, it's an extra selling point.
: )Same goes for PhotoCD, being an extra selling point that is, don't know if
: )I'll need PhotoCD capability as yet, it has possibilities I've recently
: )found out.

: The Photo CD stuff does interest me quite a bit as well - but that's
: something that comes standard with all of the CD systems (say, does
: anyone know if all of the CD systems handle multisession?).

: The thing is that the FMV carts cost as much as a cheap LD player
: (like you said, they aren't great at that price!) or a fairly nice
: VCR. The problem is that the only feature you get is the ability to
: play these CD-ROM movies - you can't record like a VCR, and the
: picture quality is worse than LD. Given that most people buying a
: $400+ game machine probably already have a VCR, I just can't imagine
: not springing for a LD player instead of the FMV cart.

I've got a VCR, but I'm fed up with degraded video tapes that I rent
from the video store. There's only a few places that actually rent
out LaserDisks, charge quite a bit of money and are about a 100 minute
round trip journey away. The hassle-factor would put me off from
buying a laser disk player.

The price has dropped dramatically, but nobody has bought one. I'd get
one just to view Anime and a few director's cuts of a few movies.

I would purchase a laser CD video player if the local video store
actually stocked CD-Videos. Making a CD-Video is probably going to
be cheaper than making a Laser-Disk, because any audio CD manufacturer
has the capability of making CD-ROMs and CD-Videos. So the CD-Video
has the possibility of being cheaper than Laser Disks.

Anybody know the costs of making VHS video tapes compared to CD-Video
or CD-ROMS and LaserDisks. The costs could be equivalent, but the
retail price of a LaserDisk is horrendous.

: Aren't there a lot more titles on laserdisk? I just view this FMV
: cart stuff as an industry attempt to sell us something we really don't
: need - and I have trouble imagining who will want it!!

It's not a FMV cart. You'll need some sort of CD-ROM player (Jaguar
doesn't have this yet).

If there a lots of titles on laser disks, they're probably only a
fraction of the VHS, or even Beta titles out there. If Video-CD
takes off, I'll get one.

With enough marketing, the public can be fooled into buying anything. I suspect a lot
of the problem is that people don't know what is wrong with FMV images and unless
your looking for it, you probably wont see it. If you are a film buff and want the
very best image, you will be able to see the difference between FMV in all it's
forms and laserdisc. Laserdisc is better by quite a margin. The undiscerning viewer
will probably be quite happy with FMV.

I see the cost of the FMV modules as the single biggest stumbling block to Video CD's (rather the same problem I think 3DO has, but that is another discussion).

The quality is not a stumbling block...the public's acceptance of VHS VCR's is proof enough of that. Also, they would have some advantages...durability, small size (especially compared to laserdiscs), and, if I understand, the ability to perform special effects (i.e. still frames) on any disc. (Unless you have a laser disc player with digital freeze, don't expect to do this on anything except a CAV disc...on which you pay a penalty of having to flip or change the disc every 30 minutes instead of every 60). Also, if it begins to catch on, I would expect to see multi-disk (carousel-type) machines for handling video-CD discs at a slight premium, just as 5-disc audio CD players are now available for a slightly higher price. Imagine being able to watch the entire uncut version of "Dances with Wolves" without once having to get up and flip or change a disc. (For the record, laserdisc players that automatically change sides and/or have digitial effects are typically in the same price range or higher as CD-32 or CD-I + the FMV module. My best friend is *heavily* into laserdiscs. He not only has a huge collection of discs, but has *3* laserdisc players in his home, for goodness sake! [Yep, he needs therapy <grin>]).

# 3305. Re: CD32's HAM8 mode -IS- True 24-BIT color

", YOU CANNOT DO SPRITES AND BOBS IN HAM8-MODE !"
Why not? If you are talking about Amiga hardware sprites, why would they be disengaged in HAM-8 mode? As to BOBs (Blitter OBjects), I could see where they would be problematic, but not impossible.

That say, the evidence of lack of HAM-8 games (and even HAM[6] games) would seem to indicate that HAM8 presents too many problems vs. advantages for use by game programmers.

For what it is worth, I own and use both a 4meg STe, and a 5meg A500, so I have no reason to be biased.

IMO, both Atari truecolor (15/16-bit color), and Amiga's HAM-8 have their uses to which each is best suited.

If I were writing a game, I would rather use the Atari's 16-bit mode. When you are moving quickly, it is easier to handle it's 'straight-forward' format than that of HAM8.

However, when dealing with still images, or anims played from disk or memory, I would *usually* pick HAM8, due to the 50% lower memory requirement. Of course, there would be *some* images that would look better in 16-bit mode than HAM-8, but in "real life" (especially photorealistic images), not many. I have seen 16-bit graphics in real life (on a PC, not a Falcon 030... sorry, but in the case of still graphics, there should be no difference), 24-bit graphics in real life, and side-by-side photos of HAM8 and a 24-bit pic of the same scene. Frankly, I could not tell any difference in the photo of the HAM8 scene and the 24-bit scene (admittedly, this was one scene, and the only one I recall seeing that also showed the same pic [from a 24-bit source] shown as both HAM8 and 24-bit). Of course, I have also seen many 15/16-bit pics I could not tell from 24-bit.

For moving graphics, and especially if viewed on a composite monitor or television, I doubt 99% of the population could tell whether an image was 15-bit, 16-bit, HAM8, or 24-bit.

Since most games have fast moving graphics, and most will be viewed on a TV via an RF or audio/video connection, most of this is debate simply for the purpose of debate.

In the case of the Jaguar vs. CD-32, I would say the Jag has the edge. Although I expect many games will only use 8 or 16-bit graphics (to save space), I do not expect to see any HAM8 games for CD-32, nor many games on either that make extensive use of the highest resolution (not on the Amiga due to DMA contention, and not on the Jaguar due to cart space limitations... even with the compression and cart sizes available).

# 3308. Re: HAM8 and the 64 base colors

"256 colors would probably be adequate to wow the
low-end game market. I don't think they need to do
more than that... and I think that's probably
about the level of quality we'll see."

I agree with you on that. Consider the PC game market. Although there are very likely more PC's out there now with 16-bit and even 24-bit capable VGA cards than there are Amigas and Ataris (ST's, STe's, and F030's) combined, you would be hard pressed to find games using 16-bit or 24-bit graphics.

> full speed?
Yes, and it looks awful.
All those square shaped non-moving parts are really annoiing. If I want to
watch a film, I want the complete film and not only half the film moving and
the rest staying in place.
Film fans claim that MPEG is better than VHS but lower than SVHS or LD.

> Hahaha. So you mean that S-VHS doesn't remove data? What a joke. It's
> lossy, too. Just in a different way to the digital MPEG.
I prefer the loss of SVHS to the MPEG square-shaped loss.
I even prefer LD to SVHS. LD has CD quality audio. Try to do that with MPEG.
The MPEG sound is compressed too (DCC/MD crap, you know?).
I recently saw the very special T2 edition on LD. That was brainblasting.
Excellent picture quality, excellent sound. And 3 sides of 'making of'.
All in CAV (distinct pictures, 25/s) try to do that on CD!

Georges.

Dale Adams (Dale_Adams@gateway.qm.apple.com) wrote:
: <Lots of true stuff, but this thread is getting boring> :)

I think you know what I mean, and vice versa. So there is no use continuing to write on this subject. Yes, the HAM8 is worse than true 24-bit graphics. But it is much better than 256-color modes, for most pictures. Of course, if I had the choice of having 24-bit color or HAM8-color, I would prefer 24-bit. And I still think that HAM8 looks better than 16-bit TrueColor. (All comparisons in the same resolutions, of course.)

Have fun, Kristofer.

P.S. I think it's cool seeing an Apple employee (I presume) that can look up from QuickTime, PageMaker, MS-Word and Excel to discuss real stuff! :)

>

Well, with the Amiga, if you get outside the 64 base colors and cannot make the transition from the preceding pixel's color...you'll get the same effect on vertical lines, won't you?

For example, let's say the programmer picks the wrong 64 colors for his image and slaps a vertical red line on a blue background. The pixels to the right of the red line should show some blurring if, say, the 64 colors chosen were all shades of gray, for example. So you wind up with (what on my old Coleco ADAM was called) "color bleeding".

JPEG, as I understand it, wouldn't have such a problem.

The thing I'm still wondering about is, how can someone do interactive animation without a lot of memory in HAM8. I'll use a videogame as an example...

(you're more experienced in programming games, so correct me if I'm wrong)

If the source image for a background is HAM8, and it is maintained in memory and then copied to the screen each time, and an image is blitted on top of it (say, the player's "ship"), the ship has now destroyed at least some of the information related to the current screen's display of that background. The original information is untouched because it was just copied to the screen. However, what you have done now is lost the advantages of hardware scrolling... or so it would seem.

Considering that HAM8 is the only mode on the CD-32 comparable to the Jag's full 24-bit capability, or even the Falcon's 16-bit TrueColor modes... it seems to me that one advantage of these "Atari" modes are that they are faster to work with. A 16-bit image placed on top of another 16-bit image could be XORed out of existence. However, a HAM8 image placed on top of another HAM8 image can't have that logical operation done because the color of a given pixel is dependent on the color of the preceding pixel, and at the points where the two images meet, data is lost in the image that occurs "after" (to the right).

I'm not going to say this is the "gospel", but I think there is logic to this. If I am right (and if I'm wrong, I'd like to see how it is done), this would make HAM8 a lot less attractive for "fast" user controlled animated graphics, such as videogames.

## 3312. Laserdisc vs. VHS

I agree... but then, I think most people (like me) who have laserdisks
also have VCRs. I tend to rent a movie on VHS and then if I really like it,
buy the laserdisk version.

>The price has dropped dramatically, but nobody has bought one. I'd get

>

I agree on that. <--- sentence rarely said in *.advocacy

>I would purchase a laser CD video player if the local video store
>actually stocked CD-Videos. Making a CD-Video is probably going to
>be cheaper than making a Laser-Disk, because any audio CD manufacturer
>has the capability of making CD-ROMs and CD-Videos. So the CD-Video
>has the possibility of being cheaper than Laser Disks.

This I totally disagree with. Why? Well, CD and audio tape cost nearly
the same to make in medium-sized quantities. Yet CDs cost nearly
double the price. Why?

>
>Anybody know the costs of making VHS video tapes compared to CD-Video
>or CD-ROMS and LaserDisks. The costs could be equivalent, but the
>retail price of a LaserDisk is horrendous.
>

This is true in some cases, but not all. I've seen a lot of laserdiscs
that retail for $30-$45 for the normal version and $60-$90 for the CAV
version.

>It's not a FMV cart. You'll need some sort of CD-ROM player (Jaguar
>doesn't have this yet).
>

That's a minor problem: Jaguar has theirs up and running and apparently
developers have had these already.

Hmmm... many more postings from this guy, and there'll be a world wide exclamation mark shortage. Sheeesh, you can almost hear him gasping for breath between sentences from here. :)

There's nothing at all wrong with a ST... you can pick one up from 80 quid here now... new!

That won't buy you a "windows driven" application for a PC... :)

: |> it using.
: !!!!!!!!!!!!!!! What do you think everyones spent the last 3-4 months arguing
: over!!!!!!!
: The specs have been regularly and deeply discussed. here they are again. They
: have been editied and commented by someone who was present at the Atari trade
: launch.

: * 64-bit RISC multiprocessing architecture.

: * High-speed (106.4 Mbyte/sec) 64-bit data path

: * Five processors:

: > 27 MIPs Graphics Processor with 4K bytes of zero wait-state internal
: SRAM that is closely coupled to the blitter, that can perform a full
: range of graphics effects (including shading and rotations) at high
: speed, yet is programmable for maximum flexibility.

: > A programmable Object Processor that can act as a variety of different
: video architectures, such as an advanced sprite engine, pixel-mapped
: based systems, character-mapped based systems, and many others.

: > 27 MIPs DSP [Digital Signal Processor] with 8K bytes of zero wait-state
: internal SRAM for CD-quality sound and full stereo capabilities.

: > A blitter that can perform a full range of logical operations at high
: speed, with hardware support for Z-buffering and Goudraud shading.

: > MC68000 CPU clocked at 13.3MHz as a general purpose control processor.

: [Five processors do not equal five chips; see below]

: * Lifelike quality 32-bit color on NTSC or PAL television screens, yielding
: greater than 16 million colors (16,777,216 exactly).

: * Screen resolution of 720 x 576.

: * ROM cartridge capacity to 48 megabits [6 megabytes] of compressed or
: uncompressed code. When compressed, equivalent to almost 400 megabits.
: [50 megabytes?!?]

: * 16 megabits [2 megabytes] of fast page-mode DRAM.

: * An optional double speed CD-ROM drive. ($200, sometime during 1994)

: * ComLynx I/O for networked multiconsole games (even with Lynx and Jaguar
: mixture).

: [I smell a Lynx adaptor for the Jaguar in here. And the idea of chaining
: Jaguars and Lynxes is tantalizing]

: * Two (expandable to literally dozens) enhanced controller ports, supporting
: digital and analog interfaces, as well as keyboards, light guns and mice.

: [Expansion probably by a multiple-port tap, naturally]

: * High performance, ergonomically designed, controller with joypad, three
: fire buttons, Pause, Option, and 12-key keypad with game-specific
: overlays. ["Ergonomically designed"? Definitely press release hype]

: * High speed synchronous serial port for connection to modems, cable TV,
: networks and other high performance networks.

: There are two custom chips, code-named Tom and Jerry, which combined contain
: four processors. Jerry has the DSP, the 8K SRAM, a sound block and a block for
: "timers, UART, joysticks and clock control." Tom has the "DRAM memory
: controller, object processor, GPU (w/ 4K SRAM) and the blitter." The 68000 is
: separate as it has the DRAM and cartridge/CD-ROM ties.

You know, the CD32 does have a 1MB Operating System. A few kilobytes
of that is dedicated to handling the NVRAM. It's basically a filesystem,
with a special menu for the user where you can delete files and so on.
---

How is this menu accessed? The 3DO has something like this, but no-one knows how to get to it!!

I have no objection to HAM8. It's very good for certain things, animation
in particular as there's less data to move around. (It's not entirely
incorrect to view it as a type of hardware compression scheme.) It's a
very economical way to get much better than 8 bit display capability out
of a video memory system which can only store 8 bits/pixel. My only
reason for responding to this thread at all was to dispute the claim that
HAM8 and 24-bit were identical.
'Nuff said...

> P.S. I think it's cool seeing an Apple employee (I presume) that can

Yeah, I'm an Apple employee - a hardware engineer who's done a fair
amount of work in the graphics/video area. So, I usually look up from a
schematic layout program to visit various newsgroups. ;-)

Just a little correction: AGA is 32-bits. Paula (the sound chip) is not
part of the 'AGA' chipset.

|> in their stance and views.

I think that the generalizations that you are making about 'most' Amiga users
work the same about ATARI ST users, don't they?

After all, who's the arrogant when it is *BLOODY OBVIOUS* that a machine like
the ST line has inferiour hardware *AND* inferiour software/3rd party support
to the Amiga in general (excluding the music/midi market).

Now, before you include me in the 'most Amiga user's ' type, I'll just let you know
that I *DO* like the Jaguar prospect, and I congratulate ATARI so far (if they don't
screw it) about doing something C= should have done quite a long time ago.

|> true in the UK, however.

I don't think the CD-32 is 'superiour' to the Jaguar, but I'll say that
at the price it is sold is very attractive considering the CD-ROM. The
CD-ROM being double speed/multissesion is a very nice feature indeed.

|>
|> Here is an extract from one such Amiag user.
|>
|> >Reread what I said, and dont call me a dimwit. The number of Jaguar units is

|> the smallert. Look at Elite II. Of course, a CD will allow more freedom, and it is
|> the logical step to take, but dont underestimate the capacity of a cartridge.`

Well, true and false. A good game designed on a CD-ROM will kick butt
vs a cartridge game precisely on game type Elite/Frontier where you could put
a bazillion of info.

Now, a Star Raiders could be done on the Jaguar in AWESOME ways, and I pray
ATARI makes a DARN GOOD Star Raiders... this alone will make me buy one.

|> >2) The CD^32 has higher color capabilities at higher resolutions than the
|> > Jaguar.
|> Does the Jaguar not have 32-bit colour values? This 32-bits does not translate

|> do those algorithms in REAL-TIME ..

Rickard, here's why I can't believe you are a programmer (or perhaps fanatism makes people * REALLY * dumb).

It has been explained once and like more than 3 times for me at least, that you can indeed animate real-time with sofware sprites in HAM8 with no color 'fringe' and no CPU-time loss.

AGAIN, the recipe:

* on every ham8 odd column, use one of the base 64 color registers

* do the same with the bobs

* move the bobs in odd boundaries, so they always start with a base register in that horizontal line

* No real-time calculations, just like any NORMAL software sprite, the data is already there

* Use the blitter... no problems

* if the movement looks 'coarse' use a 640x xxx screen. this will make the x movement look with a '320' resolution again

* YOU CAN ALWAYS USE THE SPRITES!

* you can do horizontall scrolling with no problems-> make sure you scroll on odd column boundaries

---

Tell me Rickard, is this *THAT HARD* to understand?

If you can't then you don't know how even the old HAM mode works at all....

Well, the Jaguar is shipping now, and it has a sound chip capable of handling
16 bit audio at up to 200 Khz, or a more reasonable 4 tracks at 50 Khz, which
is better than CD quality, so I'd say it has CD quality Audio. I'll give
you the benefit of the doubt and assume that you misread CD quality audio
as "CD Audio", i.e. playing music from a CD...

> AGAIN, the recipe:

> * on every ham8 odd column, use one of the base 64 color registers

> * do the same with the bobs

Doing, this, every other pixel is one of the base 64 colors. So what advantage is there to having it in HAM8 if half the screen is, for all intents and purposes, only a 64 color display? If HAM8 can change 6 bits of the previous color, then each odd pixel would be one of 64 colors, and each even pixel would be one of 64 * 6 bit modification (64 again) = 4096 colors. How can this be better than 16 bit? you're using 8 bits to get 12. ooh...

~Chris

Technical corrections welcome.

The AGA chipset allows sprites in ANY res mode. BUT... the
reason why you don't see to many HAM8 games is...

Firstly, AGA is a fairly new chipset. While SOME companies had
dev systems early on, many developers don't even have Commodore's AGA
manuals yet! (they seem to be reluctant to give them out..)
Also, since most game developers really don't want to develop
for hard drives because they claim it boosts piracy, they have to fit
games on 2-3 disks... HAM8 pics take up a lot of space, so in order
to fit them on a bunch of floppies they avoid HAM8.
For scrolling etc. HAM8 is very slow. It's good for animations
etc..but as far as in-game graphics it really won't work too well...
(unless some super-coder can make some good scrolling routines) Expect
to see some dynamite intermissions etc. in HAM 8 though.

: as "CD Audio", i.e. playing music from a CD...

What kind of DAC's does it use and what is the Signal to Noise ratio?
If it's less than 96, I don't know about CD quality. There's lots of
computer sound-cards that tout "CD quality" just based on the sampling
rate, but without a clean environment, all that electrical interference
affects the sound-quality.

Ooooops, sorry. The AGA chip is 32 bits, of course, since it is the entirely new chip C= designed. It was the Blitter that is 16 bit, right?

Some people should flame you to death for this statement. Once again:
CD^32 GAMES will only run in 352*256 with 256 colours. The resolution of
7xx*5xx should give results comparable to LDs, as this is considered as
THE maximum resolution of TV sets all over the world.
And there is still NO monitor that will display 1280*512 at 15.6 kHz,
at least you can't buy one of this type any more. the last 15-38kHz
multisync is the Mitsubishi EUM 1491A (14", .28 mm tube). This one will
only display about 8xx*6xx pixels. For 1280*xxx you definitely need a
17" monitor (plus a ScanDoubler).

>manuals yet! (they seem to be reluctant to give them out..)

Well, if this is indeed the case, why are there allegedly so many
AGA games for the 1200, and if these games don't exist in quantity
(as you say) then doesn't this mean the CD-32 ports are ports from the
Amiga 500/2000 series?

> Also, since most game developers really don't want to develop
>for hard drives because they claim it boosts piracy, they have to fit
>games on 2-3 disks... HAM8 pics take up a lot of space, so in order
>to fit them on a bunch of floppies they avoid HAM8.

This goes along with what I said earlier about CD-32 being overpriced
because the ports from the Amiga wouldn't use the CD-ROM drive to
accomplish anything that couldn't be done on a cartridge.

Considering the 1200 has a ds/dd 880k drive, 3 * 880 is about 2.5 MB.
Jaguar carts can hold that much, easily. And since the games are all
priced at under $60, apparently that means the CD-ROM has yet to be
seriously used if a majority of the games are Amiga ports.

> For scrolling etc. HAM8 is very slow. It's good for animations
^^^^^^^^^^^^^^^^^^
I don't see why it should be slow. Can't you make a large virtual
area and use the hardware scrolling for that? If this is the case,
then perhaps now we see where the Falcon's 16-bit true color mode is
nicer for some uses because the 16 bits/pixel setup with the pixel
value being independent of a CLUT or the prior pixel's values would
reduce overhead and generate a *fast* colorful display.

>etc..but as far as in-game graphics it really won't work too well...
>(unless some super-coder can make some good scrolling routines) Expect
>to see some dynamite intermissions etc. in HAM 8 though.
>

That's what I expect from HAM8 as well. That's why I've disagreed
strongly with those who believe HAM8 is as useful for interactive
things like videogames. For running MPEG, though, to be fair, it
probably would be as good as a true 24-bit board because the method

would probably both save data and it's limitations would probably be less visible with decent updating.

Well, that's a given. :) But a mouse pointer usually isn't a 128x128
image with 24-bits of depth. :)

What I'm interested in finding out about is how good the performance of
HAM8 is when you have multiple HAM8 source rasters (with different
base colors) being blitted to the same screen. I think that's the
biggest flaw of HAM8 is that if you don't have sources that utilize the
same base colors (which, if the system is using a CLUT for these, also
would have to have the same indices in the CLUT), there will be either/both
alterations to the final display (because of conflicts between the desired
base colors and the transitions along edges between images due to the nature
of HAM mode relying on the previous pixel's values) and a loss of speed
because of the need to do a lot more calculation (at least initially) to
make sure the images use the right colors.

I am not sure that it would be practical for a videogame to keep a 24-bit
representation of everything it will use. The amount of memory required
would be prohibitives. Also, it loses the advantage of HAM8, which is
the compact size of the display.

>
> AGAIN, the recipe:
>
> * on every ham8 odd column, use one of the base 64 color registers

Whoa. For those (like me) who have jumped into this a bit late, does this
mean that all of the pixels of every other other column must consist of
one of the 64 base colors? If so, this is kind of odd... although I
haven't seen the results, it sounds somewhat funky.

>
> * do the same with the bobs
>
> * move the bobs in odd boundaries, so they always start with a
> base register in that horizontal line
>

Which also eliminates the possibility of movement by a single pixel, which
means "smooth" animation may not be possible if the desired effect is to
move an image 1 pixel horizontally at a time. So you're kind of being
forced to do some contortions here....

> * No real-time calculations, just like any NORMAL software sprite,
> the data is already there
>
> * Use the blitter... no problems
>
> * if the movement looks 'coarse' use a 640x xxx screen. this will
> make the x movement look with a '320' resolution again

But if you use a 640xXXX screen, you're using 2X as much memory to give
it a 320xXXX feel.

Since you're doubling the width, you're essentially making this require
2X as many pixels per display.

Why not just use a natural 16-bit display? For animated sequences, I think
the difference between HAM8 and the Falcon's 16-bit true color display

would be minimal, and the Falcon's display would have the advantage of not having to force the programmer to make concessions to get animation with thousands of colors.

(this is not intended to say the Falcon is better, etc. etc. but just to show that the number of possible colors on screen at once is not the end-all be-all of evaluating a display... )

The Amiga enjoys an advantage when it comes to 3rd party support, but I hardly
think it's "Bloody Obvious" it has superior hardware. Out the box, the
differences between the two platforms are pretty minimal. The only major
product Commodore has is a 68040 Amiga which costs twice as much as a
Mac Quadra 605 ($995 at CompUSA).

Speaking of Macs, let me throw something out to everyone: with Mac prices
so low, does anyone else see them crowding the Amiga and ST/Falcon out of
the $1000-$2000 computer market?

(because these Quadras are real tempting)

I don't think anyone is really able to answer the question except Atari.
And Atari doesn't release that information usually. I think it has to do
with not telling your competitors anything that they might be able to use
to beat you. It's similar to a clothing store not telling anyone what his
markup really is.

Terry

)I've got a VCR, but I'm fed up with degraded video tapes that I rent
)from the video store. There's only a few places that actually rent
)out LaserDisks, charge quite a bit of money and are about a 100 minute
)round trip journey away. The hassle-factor would put me off from
)buying a laser disk player.

But none of that would change if you get the FMV video cart - you'd still have to drive 100 min. to rent a CD-ROM. Unless the whole industry decides to switch to CD-ROm, you'll only see them in the kinds of places that have LD's now - like Blockbuster.

)
)The price has dropped dramatically, but nobody has bought one. I'd get
)one just to view Anime and a few director's cuts of a few movies.
)

That's what I want a LD for...

)I would purchase a laser CD video player if the local video store
)actually stocked CD-Videos. Making a CD-Video is probably going to
)be cheaper than making a Laser-Disk, because any audio CD manufacturer
)has the capability of making CD-ROMs and CD-Videos. So the CD-Video
)has the possibility of being cheaper than Laser Disks.
)

But it really isn't that much cheaper to make a CD-ROM over a LD. The mastering systems may be cheaper, but after that they are about the same cost.

)Anybody know the costs of making VHS video tapes compared to CD-Video
)or CD-ROMS and LaserDisks. The costs could be equivalent, but the
)retail price of a LaserDisk is horrendous.
)

Well, I imagine that the biggest drawback to tapes is the duplication - LD's and CD-ROms you can just stamp out, but Video tapes have to be written to first.

): Aren't there a lot more titles on laserdisk? I just view this FMV
): cart stuff as an industry attempt to sell us something we really don't
): need - and I have trouble imagining who will want it!!
)
)It's not a FMV cart. You'll need some sort of CD-ROM player (Jaguar
)doesn't have this yet).

Yes, and a FMV cart - just like all of the other systems. There are *no* systems shipping today that include the MPEG FMV cart nessicary to play these movies - it costs $200-$250 extra!! Once again, I ask why not just buy a LD? The CD-ROM movies are going to have all of the same problems LD players have had, so you're just asking for it if you buy one.

I do wonder though how many titles are out on LD - does anyone have a rough idea?

)
)If there a lots of titles on laser disks, they're probably only a
)fraction of the VHS, or even Beta titles out there. If Video-CD
)takes off, I'll get one.
)

That's a mighty big if. I agree that if a lot of stores carry them and a lot of titles are availiabe, it might be worthwhile to get one. I just don't see this happening though, with the LD already on the market for awile.

I know.. I'm a rabid Amiga fan, but a $995 Quadra 605 IS a nice
deal for a nice machine. And I paid $1599 for this A4000/030... *sigh*

: >manuals yet! (they seem to be reluctant to give them out..)
:
:
: Well, if this is indeed the case, why are there allegedly so many
: AGA games for the 1200, and if these games don't exist in quantity
: (as you say) then doesn't this mean the CD-32 ports are ports from the
: Amiga 500/2000 series?

Well a few of the big game companies did get AGA dev systems early
on. I think they were originally hacked up Amiga 3000s with AGA features.
Psygnosis was one of them, I think... Team 17 also has the AGA official
docs, I think.
However, while it does help to have the manuals there's a lot of
common ground between the ECS and AGA chipset. That's why you are seeing
a decent amount of AGA games these days (but not enough.). However, some
of these games are REALLY sad. Ocean's Sleepwalker claims to be A1200
'enhanced' but it only has 8 extra colors! I also hear it uses one
of the newer dual-playfield modes...but still, the improvements are trivial.
This goes for a lot of games... The same goes for Gremlin's Zool AGA.
Zool adds in an extra layer of parallax, but it's no biggie. (These
two titles were rushed out the door last Xmas for the 1200 release though).
Even now, a year after the 1200s release most AGA games do not seem that
great. I'm sure the learning curve isn't THAT steep though. We should
see some really great ones when Psygnosis, Team 17, etc. finally release
their AGA titles.
Also, a lot of AGA titles will be comprised of PC ports where they
just toss the PC VGA graphics on the Amiga version. (Civilization AGA does
this...).

:
: > Also, since most game developers really don't want to develop

:
:
: This goes along with what I said earlier about CD-32 being overpriced

: because the ports from the Amiga wouldn't use the CD-ROM drive to
: accomplish anything that couldn't be done on a cartridge.

Well, I wouldn't go that far. I think that once developers get
heavy into CD work they will use the CD to full potential. At the moment
games like Pinball Fantasies, DeepCore, etc. are shovelware. Once CD32
specific games start hitting the shelves, you'll start seeing some good
stuff (Lawnmower Man looks like it will be a good example). I'm sure
you'll see companies taking advantage of the CDXL/VAXL motion video
etc...

:
: Considering the 1200 has a ds/dd 880k drive, 3 * 880 is about 2.5 MB.
: Jaguar carts can hold that much, easily. And since the games are all
: priced at under $60, apparently that means the CD-ROM has yet to be
: seriously used if a majority of the games are Amiga ports.
:

Early on, most of the games will be Amiga ports... but later into
the CD32s release developers will start making CD32 specific titles
that do take advantage of CDROM technology.

:
: > For scrolling etc. HAM8 is very slow. It's good for animations
: ^^^^^^^^^^^^^^^^^^
: I don't see why it should be slow. Can't you make a large virtual
: area and use the hardware scrolling for that? If this is the case,
: then perhaps now we see where the Falcon's 16-bit true color mode is
: nicer for some uses because the 16 bits/pixel setup with the pixel
: value being independent of a CLUT or the prior pixel's values would
: reduce overhead and generate a *fast* colorful display.

Well, I'm not a big coder, but I suppose this is possible. However,
if you use a large superbitmap instead of blocks you'll eat up the 2mb of
chip RAM very quickly. Possibly the Aikiko C2P chip can help with this,
but I'm still a bit foggy on what it does.

: >etc..but as far as in-game graphics it really won't work too well...

: things like videogames. For running MPEG, though, to be fair, it
: probably would be as good as a true 24-bit board because the method
: would probably both save data and it's limitations would probably be
: less visible with decent updating.

Well, HAM8 will be great for intermissions, stills, and animations.
Even if the in-play graphics are 256 colors, good intros etc. can add a
lot to a game. I'm not sure how Commodore's MPEG/VideoDisc thingo works

(what resmode it goes through etc.) but from what I hear it's VERY impressive.

thanks....

|> and it sounds like it would
|> work, but be a drastically inferior game look...

No, I don't think so. Remember you have to store 64 colors with different intensities in such a way that you can alter with one pixel change to those colors that you probably want in an image.

It won't look bad...

|>
|> > AGAIN, the recipe:
|>
|> > * on every ham8 odd column, use one of the base 64 color registers
|>

|>
|> Doing, this, every other pixel is one of the base 64 colors. So what
|> advantage is there to having it in HAM8 if half the screen is, for all intents
|> and purposes, only a 64 color display?

That if you use a 640x 200 (400 is more, or x 256 PAL) screen, you get 64* 1024 colors + 64 colors. Add to this copperlist tricks and you have a darn colorful screen.

|> If HAM8 can change 6 bits of the
|> previous color, then each odd pixel would be one of 64 colors, and each even
|> pixel would be one of 64 * 6 bit modification (64 again) = 4096 colors.
|> How can this be better than 16 bit? you're using 8 bits to get 12. ooh...

Becuase you select the 64 color registers from a 24-bit palette, and make them different. If you read *above* you realize that you can have more using copperlists.

The other thing: it isn't 64 * 6 bit modification = 4096. Multiply that times 3 because you modify 8 bits of each RGB value.

Combine copperlist tricks now, and you get a darn colorful screen.

The proof is left as an exercise to the student.

(thanks for bringing the possibilities number though, didn't occur
to me offhand. But again, you can change the registers every single
horizontal line).

NOPE, IT WON'T!

|> and the Falcon's display would have the advantage of
|> not having to force the programmer to make concessions to get animation
|> with thousands of colors.

ARGGGGGGGH you are getting this wrong again! :-)

For animation HAM8 has no problems at all in making concessions! This is
how the anim format works in my machine every day!

We were talking about having BOBS or Software sprites pasted using the
blitter and/or cpu. I just mentioned a scheme for avoiding heavy CPU time
and calculations of remapping the 64 registers.

|> (this is not intended to say the Falcon is better, etc. etc. but just to
|> show that the number of possible colors on screen at once is not the
|> end-all be-all of evaluating a display... )

Okay, I understand Charles, and I like your postings. But read above.

About animation:

* Remember: no problem at all because for the AMIGA, HAM8's memory
looks just like an 8-bit plane memory. Animations
operate by doing delta's and storing them quickly
in those bitplanes.

You HAVE NO color fringe in animations that have been
pre-calculated.

For BOBS, I provided a solution.

To finish this, remember that you don't need BOBS all the time.

Comparing it to the ST/STE line? Of course not!

Charles, I was going to buy an ST back in 1986, but I always acknolwedged
that the Amiga had a way better architecture. How can you explain
the lack of DMA sound for quite a while, lack of scrolling, lack of
sprites, lack of a blitter in the ST machine?

Same goes pretty much for the STE in a lot of areas.

[oops! line accidentally deleted]

|> product Commodore has is a 68040 Amiga which costs twice as much as a
|> Mac Quadra 605 ($995 at CompUSA).

Well, in that case, Atari has a problem too ;-)

|>
|> Speaking of Macs, let me throw something out to everyone: with Mac prices
|> so low, does anyone else see them crowding the Amiga and ST/Falcon out of
|> the $1000-$2000 computer market?
|>
|> (because these Quadras are real tempting)

I can see it, of course! But the Amiga and Falcon/ST line have been
in that situation before. What will happen is that the ST/AMIGA will
continue in their niches, but more and more 'just there.'

General purpose wise, the Apple machines are way better.

Now, the problem I have seen is that ATARI's market (computers) have
been going down down down, and C='s is just 'slowly still going forward',
not to mention that C='s continues to gain more and more market in the
Professional Video Arena.

Judging by what seems to be Falcon's sales, looks like ATARI might
be actually losing some more popularity.

No flames, my opinions.

:#JC> Okay, this is from this month's AmigaWorld:
:#(List of loads of developers and games)
:#Did you notice that only a few of those were using AGA graphics, and that the
:#rest were A1200 games copied to a CD?

Oh sorry, the article I copied and paraphase from didn't list whether or
not they were AGA, except that most were ports from A1200 games. There was
another article further in that had a list of the games that were AGA
specific. Here's the list, you can compare them with the one I put up
earlier to see which are AGA and which are not.

Games Publisher
Air Bucks 1.2 Impressions
Alien Breed 2 Team 17
Beneath A Steel Sky Virgin
Body Blows Galactic Team 17
Brutal Sports Football Millenium
Burning Rubber Ocean
The Chaos Engine Renegade
Civilization Microprose
Day of the Tentacle LucasArts
Dennis Ocean
Diggers Millenium
Donk Supervision
1869 Flair
Fatman The Caped
Crusader Interactivision
Genesis Flair
Inferno Ocean

T.F.X Ocean
Transarctica Silmarils
Trolls Flair
Uridium II Renegade
Whale's Journey Flair
Wing Commander Electronic Arts UK
Zool Gremlin Graphics, distributed by EID
Zool 2 Gremlin

There were also 3 PD/Shareware games listed too.

I put the whole list there for you since, if they do come out on CD32,
you'll know which are AGA...8-), and not assume just because I didn't put
AGA it wasn't. As you can see, there are quite a few AGA games being put
into CD32.

:#JC> AmigaWorld. Don't have the European game magazines on hand. From a C=
:#JC> employee, there are already 38+ games released for CD32. I have his
:#JC> posting saved if anyone wants confirmation...8-).
:#Not surprising .. kinda easy for developers to copy old games to CD ..

So, I wonder how many catridge based Jaguar games will be ported to CD.
Same thing applies.

:#JC> Yes, it is less powerful than the 3DO and Jaguar but, as has been proven
:#JC> before, it's not the power of the hardware but how much software it has
:#JC> available, number of users and price. I've said this before. VHS vs.
:#JC> Beta, Clones vs. everybody else...(just had to put that in), SEGA or
:#JC> Nintendo vs. Neo-Geo, NeXT vs. not sure here.

:#Well, those were a lot closer in specs than the CD32/Jaguar .... (if you don't
:#read Clayton Donkey's postings .. )

I doubt that the specs in each case was that much closer than CD32 vs.
Jaguar. Beta offered superior sound quality than VHS, and some respects
video too, Clones didn't provide much in base hardware to any other
computer, Neo-Geo offered a lot better graphics than either the SEGA or
Nintendo could generate. Like I've said it, more goes into creating a
success than specs.

:#JC>I still don't know which console I'll purchase but, the CD32 looks good to
:#JC>me so far. The Jaguar, is probably the next candidate though if the CDROM
:#JC>isn't available by the time I'm ready then it's the 3DO.
:#Why is everybody raving about the CD-ROM? If the Jaguar can store almost 50Meg
:#of graphics on a cartridge, the CD-ROM will only be used for the absolutely
:#biggest adventures ... and really ... there's a market for other games too ..
If you put in 50Megs of graphics on the catridge where's the program?..8-).
Come off of it, even with JPEG compression, you'll still need room for the
game code. Game coding will take a lot of room and JPEG compression
doesn't do game code, right? So, expect less than 50 Megs, if the game is
about 1-2 MB, from a 5 MB catridge, then you'd only get about 3-4 MB for
the graphics, which is about 1:7 ratio as was given before about 21-28 MB
of graphics. Then how about sound? Most of the CD32 stuff has CD music,
which is what's taking up about 100 MB or so. Even the 3DO stuff will have
CD soundtracks to improve the play.

Don't forget CDs are cheaper to produce for a larger base. If you're going
to have a smaller base of users then a catridge based system is better, but
for a larger market, CDs are way better than catridge any day. If you can
tell me why a catridge is better. Other than having a faster load time.

:#Return to Zork (or whatever it's called) is already under developement for the
:#JagCD.

Why would that be on CD by itself? You can fit all the Zork games plus all
the other damned text-based games onto a CD. Hell, why bother? I've never
bought a text based game since Zork I on my C-64. Even if Return to Zork
(or whatever) is under development, you'll probably find a catridge version
first. Think about it, how is a company supposed to put money into
development into some new, untried without having some other revenues
coming in. I don't think many of today's companies have that kind of cash
on hand, especially game companies which kind of live or break upon the
games they sell, to generate revenues.

If a game developer was to develop for the Jaguar CD, they'd have to put
money up front to become a developer, purchase the necessary equipment to
program for it, start learning how to program it, take months to develop
the software for it and then wait more months til the CD player comes out
before they start seeing revenues coming in? Don't know of many companies
that can do this. Even Stefan's company is taking a wait and see attitude
towards the Jaguar, and they are already committed to the CD32.

Atari's attitude towards having a CD available for their console might end
up to be a bad move on their part. I don't know if what I keep reading
hear about Atari's moving their CD release date so, they could have more
titles ready for the CD launch is true or not but, if this is so, I'm
beginning to wonder if the number of games available for the CD launch will
be the same number of games listed for the Jaguar debut.

:#WF> of the same game released. How would you know if they don't use AGA
:#WF> graphics?

:#I can't switch channel at the moment, but someone else with access to Sky
:#Text-TV can probably tell you that atleast one game soon released on CD32 will
:#NOT use AGA graphics. (Stated in the GamesWorld section)

I can guarantee that some games will not be AGA specific. There are several bundled games coming out on CD, these mostly will be ECS games, no problem. 3 or more games on one CD, all for the price of one game, no problem. Since I've posted a list of games that are AGA specific, ports of these games will mostly have CD soundtracks and/or more levels included. Games that are originally ECS and ported to the CD32 will most likely, have some of the following done to them: graphics upgraded, more levels or more things added, CD soundtrack, more colors, etc. One, some or all these things will be done to these types of games.

Since I don't have access to Sky Text-TV, maybe you can tell us what game will be released on CD32, and if they are upgrading it at all?

I'm wondering if CDTV titles will be upgraded to CD32, not all work.

:#WF> They might be "old games", but quite a few have only have been recently
:#WF> released on the PC and/or Amiga. I'd rather have a fun "old" game than
:#WF> a crap new game. Quite a few of the games were fun on, and were improved
:#WF> for the A1200/AGA. Others are kinda naff (Dracula on the PC comes to
:#WF> mind).

:#People don't buy consoles to being able to play the same games their
:#computer-owning neighbour has had for months ... they would have bought the
:#computer if that was the case ... people buy consoles to play arcade-versions
:#of games - and since Atari Games (NOT the same as Atari Corp!) has licensed the
:#Jaguar chipset for use in their arcade-machines, you'll have some great arcade
:#conversions coming here ...

People buy consoles to play games on period. It doesn't have anything to do with what their neighbors have been playing with. Most of the kids want to have their own toys to play with and not someone elses, since it all mommy or daddy's money. For me, arcades are a thing of the past.

:#Haven't seen anyone building arcades using the CD32 .. :-)

Because they are used in simulators...8-). Pretty awesome things if you ask me. Military simulators and commercial simulators have been using it

for quite awhile now.

:#WF> Perhpas we'll talk about it when it's released.

:#Ah, you didn't like that ... :-)

No, I think he meant it's still vapourware. We can talk vapourware all you want but, if it don't exist then it don't hold a candle to something that does exist.

:#In article <CHCHvF.9C4@news.Hawaii.Edu> jimmy@Hawaii.Edu (Jimmy Chan) writes:
:#)Well, that being said, it's true the FMV stuff isn't really great but it's
:#)an extra (optional) for those that want it. You don't want it don't buy
:#)it. I myself don't care for FMV, I have a laserdisc collection. I won't
:#)be buying it for any of the game consoles but, it's an extra selling point.
:#)Same goes for PhotoCD, being an extra selling point that is, don't know if
:#)I'll need PhotoCD capability as yet, it has possibilities I've recently
:#)found out.

:#The Photo CD stuff does interest me quite a bit as well - but that's
:#something that comes standard with all of the CD systems (say, does
:#anyone know if all of the CD systems handle multisession?).

Photo CD doesn't really come standard with all CD systems. It depends on
Kodak if they want to license it to another company that could be a rival
or not. Payment for such licensing might also be a factor for some
companies. I think C= is still trying to get the license for Photo CD.

:#The thing is that the FMV carts cost as much as a cheap LD player
:#(like you said, they aren't great at that price!) or a fairly nice
:#VCR. The problem is that the only feature you get is the ability to
:#play these CD-ROM movies - you can't record like a VCR, and the
:#picture quality is worse than LD. Given that most people buying a
:#$400+ game machine probably already have a VCR, I just can't imagine
:#not springing for a LD player instead of the FMV cart.

Well, in terms of portability an FMV system might be better. Since my LD,
doubles as a karoake unit, it is a bit on the tedious side to be hauling
around with the mixer and 12" LD disks that happen to weigh a lot. FMV
might be good for those situations where picture quality isn't necessary,
but being able to randomly search sequences might be more important plus
portablity. Though like I said FMV isn't for me, but for others who might
be able to have more ideas, well. I even once consider PhotoCD to be a
near useless feature once.

:#)I think IBM or was it blockbuster, oh well, in a CNN clip that there's about
:#)3000 video titles available on CDs.

:#Aren't there a lot more titles on laserdisk? I just view this FMV
:#cart stuff as an industry attempt to sell us something we really don't
:#need - and I have trouble imagining who will want it!!

There are about 10,000 or so titles on laserdisc, I don't have a reliable
number since so many things come out on laserdisc and many titles aren't
being produced anymore. I'd say about 1/2 - 2/3 of the laserdisc titles

are worth it. The rest is a waste of laserdisc materiel. The current variety of laserdiscs are much better than what was being offered a few years back.

I once also thought that laserdiscs without being able to record anything was useless since I already had a VCR but, that changed...8-). I thought laserdiscs might be a passing fancy awhile ago.

William Fang (int877w@lindblat.cc.monash.edu.au) wrote:
:#The price has dropped dramatically, but nobody has bought one. I'd get
:#one just to view Anime and a few director's cuts of a few movies.

I guess you mean laserdisc player prices. They've come down drastically in price except for high-end units. Laserdisc have gotten much more popular now since karoake has caught on. Most all current VHS movie releases also have a corresponding Laserdisc release. Laserdisc releases have mostly the quality shows available now. It's a bit more expensive to produce laserdisc if you don't expect to sell a lot. Laserdisc owners are a fickle bunch that want mostly top quality shows...8-).

:#I would purchase a laser CD video player if the local video store
:#actually stocked CD-Videos. Making a CD-Video is probably going to
:#be cheaper than making a Laser-Disk, because any audio CD manufacturer
:#has the capability of making CD-ROMs and CD-Videos. So the CD-Video
:#has the possibility of being cheaper than Laser Disks.

Besides being lighter and smaller than laserdiscs, though I prefer the quality of laserdiscs.

:#Anybody know the costs of making VHS video tapes compared to CD-Video
:#or CD-ROMS and LaserDisks. The costs could be equivalent, but the
:#retail price of a LaserDisk is horrendous.

I think it more expensive to have a smaller amount of laserdiscs printed than to have a corresponding number of VHS tapes made but, it gets cheaper when you have a pretty sizable amount to make. Same goes for CDs. The retail price of a laserdisc is actually the same as VHS. Many LD titles that come out now sell for about $20-$40 range. The special LDs cost more, such as Criterion disks, which are top quality laserdiscs but not many current titles, and usually include extra footage, or director's stuff and other things. Criterions usually go for about $60-$100 or more. Then there are the LDs with Director's cut which go for about $40 and up. If you order from a mailorder place like Ken Crane they offer about 10%-20% off on new titles and they also have specials of the month, such as they had some old titles that were being sold for $9.95 a few months back, I wanted to pick up those Playboy Videos..8-).

:#If there a lots of titles on laser disks, they're probably only a
:#fraction of the VHS, or even Beta titles out there. If Video-CD
:#takes off, I'll get one.

I believe you'll find more LD titles than you will of Beta, that's for sure. LDs are only a fraction of VHS is true but I don't think you'll find too many junk titles for LD in the current crop. Junk titles do not sell well

at all in the LD market, and the LD consumers are a very fickle group of buyers. VHS has a host of crappy titles, LDs have many old ones that are junk but the current stuff is great.

I should also stress that many LD owners are collectors. After 11-13 years of owning a VCR and 1 year of owning a Laserdisc player, I now own about 3-4 times as many titles of LDs than I do of bought titles on tapes..8-)

split between graphics and sound.

)Don't forget CDs are cheaper to produce for a larger base. If you're going
)to have a smaller base of users then a catridge based system is better, but
)for a larger market, CDs are way better than catridge any day. If you can
)tell me why a catridge is better. Other than having a faster load time.
)

That's about it - I don't really think carts are better than CD's, but
for some games they are enough.

):#Return to Zork (or whatever it's called) is already under developement for the
):#JagCD.
)
)Why would that be on CD by itself? You can fit all the Zork games plus all
)the other damned text-based games onto a CD. Hell, why bother? I've never
)bought a text based game since Zork I on my C-64. Even if Return to Zork
)(or whatever) is under development, you'll probably find a catridge version
)first. Think about it, how is a company supposed to put money into
)development into some new, untried without having some other revenues
)coming in. I don't think many of today's companies have that kind of cash
)on hand, especially game companies which kind of live or break upon the
)games they sell, to generate revenues.
)

Return to Zork is supposed to be a much more graphical game - it's
already out I think for some other system (CDI?). I think they are
also planning a CD release.

)If a game developer was to develop for the Jaguar CD, they'd have to put
)money up front to become a developer, purchase the necessary equipment to
)program for it, start learning how to program it, take months to develop
)the software for it and then wait more months til the CD player comes out
)before they start seeing revenues coming in? Don't know of many companies
)that can do this. Even Stefan's company is taking a wait and see attitude
)towards the Jaguar, and they are already committed to the CD32.
)

There are already a few Jaguar CD developers, and others will come
along soon I'm sure.

Should I be worried that stefefan's company is waiting for Jaguar
results? Does he work for Microprose or something?

)Atari's attitude towards having a CD available for their console might end
)up to be a bad move on their part. I don't know if what I keep reading
)hear about Atari's moving their CD release date so, they could have more
)titles ready for the CD launch is true or not but, if this is so, I'm
)beginning to wonder if the number of games available for the CD launch will
)be the same number of games listed for the Jaguar debut.
)

I haven't heard anything other than here about the CD release being
moved up. I've heard they didn't want to release the CD right away,
but they were waiting a few months.

):#In article <CHCHvF.9C4@news.Hawaii.Edu> jimmy@Hawaii.Edu (Jimmy Chan) writes:
):#)Well, that being said, it's true the FMV stuff isn't really great but it's
):#)an extra (optional) for those that want it. You don't want it don't buy
):#)it. I myself don't care for FMV, I have a laserdisc collection. I won't
):#)be buying it for any of the game consoles but, it's an extra selling point.
):#)Same goes for PhotoCD, being an extra selling point that is, don't know if
):#)I'll need PhotoCD capability as yet, it has possibilities I've recently
):#)found out.
)
):#The Photo CD stuff does interest me quite a bit as well - but that's
):#something that comes standard with all of the CD systems (say, does
):#anyone know if all of the CD systems handle multisession?).
)
)Photo CD doesn't really come standard with all CD systems. It depends on
)Kodak if they want to license it to another company that could be a rival
)or not. Payment for such licensing might also be a factor for some
)companies. I think C= is still trying to get the license for Photo CD.

Are you saying that the CD-32 that is out now CANNOT USE photo-CD
disks!!!

Every CD system out now (CDI, 3DO) can read photo-cd disks right out
of the box. The Jaguar CD will support Photo-CD. I know you have to
license photo-cd technology from Kodak, but I had just assumed that no
company would be stupid enough to release a CD-system without photo-cd
support. Guess I underestimated Commodore...

Does anyone know if this is true? If so, how will people who buy
CD-32's now be able to use photo-cd's once Commodore gets the license?

Also, is the CD-32 CD-ROM player even multisession capable?

)
):#The thing is that the FMV carts cost as much as a cheap LD player
):#(like you said, they aren't great at that price!) or a fairly nice
):#VCR. The problem is that the only feature you get is the ability to
):#play these CD-ROM movies - you can't record like a VCR, and the
):#picture quality is worse than LD. Given that most people buying a
):#$400+ game machine probably already have a VCR, I just can't imagine
):#not springing for a LD player instead of the FMV cart.
)
)Well, in terms of portability an FMV system might be better. Since my LD,
)doubles as a karoake unit, it is a bit on the tedious side to be hauling
)around with the mixer and 12" LD disks that happen to weigh a lot. FMV

)might be good for those situations where picture quality isn't necessary,
)but being able to randomly search sequences might be more important plus
)portablity. Though like I said FMV isn't for me, but for others who might
)be able to have more ideas, well. I even once consider PhotoCD to be a
)near useless feature once.
)

Hmm, it is treu that portability would be good but I really consider
this to be a small factor. Who travles somewhere to watch a movie? I
can understand listening to music while elsewhere, but wy would you
take a movie anywhere else and watch it?

):#)I think IBM or was it blockbuster, oh well, in a CNN clip that there's about
):#)3000 video titles available on CDs.
)
):#Aren't there a lot more titles on laserdisk? I just view this FMV
):#cart stuff as an industry attempt to sell us something we really don't
):#need - and I have trouble imagining who will want it!!
)
)There are about 10,000 or so titles on laserdisc, I don't have a reliable
)number since so many things come out on laserdisc and many titles aren't
)being produced anymore. I'd say about 1/2 - 2/3 of the laserdisc titles
)are worth it. The rest is a waste of laserdisc materiel. The current
)variety of laserdiscs are much better than what was being offered a few
)years back.
)

I don't think things will be much different for CD-ROM movies, they
will probably release movies quite slowly. In fact, from watching the
commercials that show off the MPEG movies, I'd say that only two are
availiable - Hot shots and Plaes, Trains and Automobiles. Those are
the only clips I ever see... :-)

)I once also thought that laserdiscs without being able to record anything
)was useless since I already had a VCR but, that changed...8-). I thought
)laserdiscs might be a passing fancy awhile ago.
)

So did I, I am amazed they survived, but I guess consumers thought the
improved quality was worth it. I just can't see the CD-ROm movies
fighting the same battle and winning with laserdisks already around.

:#In a message of 04 Dec 93 05:41:01, Jimmy Chan wrote:

:#The CD32 will actually have games not using AGA ... sheesh ... hopefully people
:#will stick to their SNES/Genesis systems ..

It would be nice to have everything released to be AGA but for a new
product, it at least has software to show for it. What about Jaguar? I
think a lot of people would like to see anything as long as there were some
available.

:#JC> So, I wonder how many catridge based Jaguar games will be ported to CD.
:#JC> Same thing applies.

:#Definitely not! All cartridge games are SPECIFICALLY written FOR THE JAGUAR,
:#and they are NEW.

Try reading the sentence again. I didn't say anything about Jaguar
specific. Just what I've been saying all along, Jaguar catridge games will
be ported to CD.

Of course, you don't have any guarantee that some of the Jaguar catridge
games wouldn't be ports. All platforms have had ports of games, what makes
the Jaguar so special that it wouldn't, of course if it doesn't have ports,
I won't be expecting too many games.

:#Nah .... The Jaguar is *WAY* ahead of the CD32 ... the above mentioned are a
:#LOT closer ... (no need to enter the technicals, you will surely just argue
:#against anyway .. )

Your way ahead is a bit distorted. It doesn't come with a CDROM drive,
what's so way ahead with a catridge? It doesn't have any software except
for what it came with. We should have seen some by now.

:#JC> Don't forget CDs are cheaper to produce for a larger base. If you're
:#JC> going
:#JC> to have a smaller base of users then a catridge based system is better,

Pfffffttt. Add a CDROM player. You can keep deluding yourself with this
foolish idea. If this is the best argument you can come up with then why
do you even bother?

:#JC> Why would that be on CD by itself? You can fit all the Zork games plus
:#JC> all

:#JC> the other damned text-based games onto a CD. Hell, why bother? I've
:#JC> never
:#JC> bought a text based game since Zork I on my C-64. Even if Return to Zork

:#SHEESH .. Return to Zork ... *TEXT* .... geezuz .. yes, maybe -85 ... but the
:#Return to Zork developed now NEEDS a CD-ROM .. GUESS WHY ...

I can guess why but that doesn't mean anything. As William put it, we'll
talk about it when it comes out.

:#Hey .. surprise .. there are a LOT of Jaguar developers .. and some are doing
:#CD right now ... wake up ..

Okay, since I put up a list, you want to show me what developers there are
and how many CD developers there are? Come on any list will be fine. I've
yet to see any sort of list of developers. Remember just because they
signed up don't mean they are actively developing for it. I've seen
Atari's so called marketing gimmicks before.

:#JC> Atari's attitude towards having a CD available for their console might end
:#JC> up to be a bad move on their part. I don't know if what I keep reading
:#JC> hear about Atari's moving their CD release date so, they could have more

In article <KENDALL.93Dec4173217@great-gray.owlnet.rice.edu> you wrote:
:#But that's different - all of the Jaguar cart games are written
:#specifically for the Jaguar, while the CD-32 gets ports of crappy old
:#games which just crowd the market.

I hope you really don't believe that ALL Jaguar games will be all new games and not just ports. Even SEGA and Nintendo had their share of ports. Until there comes out a quantity of games for the Jaguar you don't know for certain what's going to be good and what's not.

:#But specs help a lot in determining the potential of a system.

Potential, yes. Success, no. The other factors determine the success of a system. Beta had more potential than VHS but more videos were coming out in VHS format. Neo-Geo, had better graphics, but price and lack of games people were will to pay for, killed it. Remember the TG-16, same pretty much as the SEGA and Nintendo but, lack of software. NeXT, great interface, albeit too slow for me, DSP, great hardware but, price killed it. Now, look at the Clones, the potential is now there but, before the potential was there it still outsold every computer platform, why? Definitely, not because of potential. A host of software is what pushed the Clones to the top of the computer heap, regardless of IBM.

Potential don't mean nothing without software. I don't see too many people buying systems with potential but no software. Of course, there'll always be those who just go for potential but that doesn't insure you'll get software.

:#That's about it - I don't really think carts are better than CD's, but
:#for some games they are enough.

Yes, for some games they are enough. I don't doubt that but for the games with mucho stuff, you'll need better than a cartridge. Even to get the most of the Jaguar you'll need to have a CD.

:#Return to Zork is supposed to be a much more graphical game - it's
:#already out I think for some other system (CDI?). I think they are
:#also planning a CD release.

I wonder how much more graphical. I hope it isn't static pictures, like I've seen some other games do. I just asssuming this is the next phase for Infocom to go to after text based games but not necessarily true.

:#There are already a few Jaguar CD developers, and others will come
:#along soon I'm sure.

:#Should I be worried that stefefan's company is waiting for Jaguar
:#results? Does he work for Microprose or something?

His is only one company but this might be the current trend among the others. In today's market, developers tend to be a little more careful since a game that doesn't do very well could cost them big. This brings to mind why you might see a few ports to the Jaguar early on. It's more expensive to develop a new game to a new system than it is to port a game that's already exists on another machine and just convert it to work on another. Oh, doesn't that mean Return to Zork is a port?

:#I haven't heard anything other than here about the CD release being
:#moved up. I've heard they didn't want to release the CD right away,
:#but they were waiting a few months.

Doesn't that amount to the same thing? The CD won't be released soon whether or not they moved up the release is unimportant. What's important is the CD won't be here for awhile as yet.

Will the Jaguar CD have FMV, PhotoCD, and whatever else is available?

:#JC> People buy consoles to play games on period. It doesn't have anything to
:#JC> do with what their neighbors have been playing with. Most of the kids
:#JC> want
:#JC> to have their own toys to play with and not someone elses, since it all
:#JC> mommy or daddy's money. For me, arcades are a thing of the past.

:#BOOO .. wake up, smell reality .. kids want what their friends have .... Kids
:#out here even BUY C64's coz almost everyone here has one!

If that's what you think, then why buy a Jaguar? Everyone would have
either want/have a SEGA or Nintendo. Since so many kids' friends have
those why bother getting something that no one has? Sheesh.

My statement still stands, they just want to play games period. We are
looking at maybe 7-14 year-olds, who don't care what's under the hood as
long as they get games to play with. How many kids are going to ask Mommy
and Daddy to get a $1000-$2000 computer system to play games with? You
know why kids get the C-64, because there is more games available for it
than for the Nintendo and SEGA, and they are lots cheaper too, sometimes
even free....8-)

:#JC> Because they are used in simulators...8-). Pretty awesome things if you
:#JC> ask me. Military simulators and commercial simulators have been using it
:#JC> for quite awhile now.

:#Military simulators using CD32's?

You don't get around much, do you. Hint: Amigas.

:#Excuse me for laughing.

Sure, I always excuse ignorance.

:#JC> No, I think he meant it's still vapourware. We can talk vapourware all
:#JC> you
:#JC> want but, if it don't exist then it don't hold a candle to something that
:#JC> does exist.

:#Ah yes .. the PowerPC is also vapourware ... and Windows NT .. and ... etc ...

If you can't determine what defines vapourware, then there is no use
explaining it to you. Oh I hope you like the Panther you must have by now.

:#The company (don't remember their name) stated themselves they are developing
:#Return to Zork for the JagCD ... isn't that enough?

Kendall, says that Return to Zork is already available on other platforms,
so doesn't that make it a port? Is one game enough for you? Btw, the
developers for the Zork stuff was Infocom. I don't have any idea if it's
still under Infocom or not though.

Huh? There are lots of CD32 specific titles under development. Titles
which will never be released in any shape or form on the A1200 or A500.
Most titles, however are developed with A1200, A500 and CD32 as the target
platforms, because you want to make as much money as possible from each
title. The computer versions will be downsized from the CD32 version.

>How many games have even 1MB of code? That leaves you with 5MB to
>split between graphics and sound.

Now get this: Jaguar games will *NOT* be 6MB. Most titles will have to
settle for much less (1MB-2MB), because the cartridge cost is much too
high.

>There are already a few Jaguar CD developers, and others will come
>along soon I'm sure.

Unless the JagCD sells in major quantities, very few will care to
develop for it.

>Should I be worried that Stefan's company is waiting for Jaguar
>results? Does he work for Microprose or something?

No. I work primarily for Team 17 and sometimes for Psygnosis. Anyway,
Team 17 is not the only company who's decided to wait and see - even some
of the companies who according to Atari has signed up as developers are
not doing anything for it yet. Some don't even have a development system.

>I haven't heard anything other than here about the CD release being

You haven't seen a list of developers? Then why are you running around with a blindfold .. it's been posted several times already ...

(I can't add textfiles to my letters in this editor, I'll post in right after)

JC> Yep. C=, Phillips, 3DO and even SGI must know something that Atari and
JC> Sega don't. I still don't understand Atari move to release the Jaguar in
JC> the US, when their strength and popularity lies in Europe.

You do know that SGI has broken whatever form of deal they had with Nintendo? (Nintendo will probably go back to the 32bit (old!) system they had in mind .. )

Atari knows that US is the best market to sell a console in ... (especially since it's "Made in America" - that alone will sell units!)

Phillips hasn't made a console - the CDi was never intended to beat the crap out of the console-market.

3DO is a flop. (remember the MSX computer standard?)

In a message of 05 Dec 93 13:17:33, Jimmy Chan wrote:

JC> Will the Jaguar CD have FMV, PhotoCD, and whatever else is available?

FMV, JagMovie (whatever that is - cinemapak surely), PhotoCD, CD+G,
Music-CD....I think those are it ...

But then, Virtual Reality helmet is under developement ... and this noone can
argue against ... the Jaguar is the FIRST console with the possibility of
delivering GOOD Virtual Reality games! (Don't even THINK that the CD32 can ...
)

One thing I've been thinking of ... the FMV module for the JagCD will probably
be a cartridge with the necessary (?) built in hardware chips ... BUT ..
I really think the Jaguar's built in hardware can do FMV decoding ... should be
no problem ... and if that's the case, Brainstorm (Jaguar developers, have
already made a 17fps MPEG decoder for the Falcon, using the DSP) will probably
make a cheap FMV cartridge that uses the Jaguar instead of external chipsets
...

Anyway: What graphicsmode is the CD32 using for its FMV?

# 3376. Jaguar developers + games list

Newsgroup: comp.sys.atari.advocacy
Date: 1993-12-05 16:55:00 UTC
From: rickard_troedsson@troed.ct.se
Message-ID: <2d021268@troed.ct.se>
Source record: 19974

Since some seems to have forgotten that there's a Jaguar F.A.Q .. here comes cuts from it ..

***CUT***

A. The following companies have been announced as official developers for Jaguar software:

Anco Software Ltd. Maxis Software Telegames
Beyond Games Inc. Microids Tiertex Ltd.
Dimension Technologies Midnight Software Inc. Titus Eurosoft
Ocean Software Ltd. Tradewest High Voltage Software
Rebellion Software Ltd. Trimark Interactive Krisalis Software Ltd.
Retour 2048 U.S. Gold Ltd. Loriciel U.S.A.
Silmarils Millenium Park Place Productions
Ubi Soft Gremlin Software Microprose
Accolade Virgin Interplay
21st Century Software Activision(?)

Also, Atari Games/Tengen has licensed the Jaguar architecture for use in future arcade games.

*** 2:nd CUT ***

A: Note: These lists are hardly definitive. It's based on many sources, and in some cases, it just might be dead wrong. Games also often change from pre-release to production.

Upcoming Jaguar cartridge games:

Title Players Description
---------- ------- ----------
Alien vs. Predator 1 Be the Marine, the Alien, or the Predator...
Al Michaels 1-2? Baseball action with play-by-play
Announces Hardball
Batman: The 1? The protector of Gotham rises again
Animated Series
Battlechess 1-2 Take the King and take a break
Battlewheels 1-6? Build it, arm it, drive it, shoot it
Battlezone 2000 1 The tank wars continue
Brett Hull Hockey 1-2? Red hot action in the ice cold rink
Bubsy in Claws 1 Save Earth's yarn from the Woolies
Encounters of the
Furred Kind
Charles Barkley 1-2 Professional basketball action
Basketball
Checkered Flag II 1? Formula 1 racing with fully rendered 3D

Cisco Heat 1 Race through the streets of San Fran
Club Drive 1? Relax at a fantasy driving vacation resort
Crescent Galaxy 1-2 Side-scrolling shooting over five planets
Cybermorph 1 Rescue survivors in a shape-changing ship
Cyberpunk City 1 William Gibson's futureview on a cartridge
Dracula the Undead 1 Escape from the Count's castle
Dino Dudes:Evolution 1? Guide humans to survive prehistoric dangers
Doom 1 Crosstime war, big guns and bigger beasts
Grand Prix 1? Indy car auto racing in 64 bits
Jack Nichlaus' Power 1? Go golfing with the great one
Challenge Golf
Jimmy Connors' 1-2 Singles or doubles, you have to face Jimmy
Tennis
Kasume Ninja 1-2 Hone your fighting skills with 91 moves
Raiden 1-2 Destroy the enemy's military might
Steel Talons 1 Take off in an Apache helicopter simulator
Tempest 2000 1 Return of the demons, spikes, and zappers
Tiny Toon 1? Stop Montana Max from mining TiToonium
Adventures

Upcoming Jaguar CD-ROM games:

Title Players Description
---------- ------- ----------
Dracula 1 Bram Stoker's creature stalks the Jaguar
Space Pirates 1? Scabbards, swashbuckling, and space
Return to Zork 1 The Great Underground Empire rises again

*** END CUT ***

>)Kodak if they want to license it to another company that could be a rival
>)or not. Payment for such licensing might also be a factor for some
>)companies. I think C= is still trying to get the license for Photo CD.

>Are you saying that the CD-32 that is out now CANNOT USE photo-CD
>disks!!!

Yes they can. Kodak sells the `Photo-Worx' CD, which is usable on all
Amiga systems including the CD-32.

>Every CD system out now (CDI, 3DO) can read photo-cd disks right out
>of the box.

Correct so far, except that the CD32 is also out now and does not have
software to view Photo-CD in the box.

>The Jaguar CD will support Photo-CD. I know you have to
>license photo-cd technology from Kodak, but I had just assumed that no
>company would be stupid enough to release a CD-system without photo-cd
>support. Guess I underestimated Commodore...

Newsflash: According to Atari, the JagCD will not have Photo-CD support
out of the box. I guess you underestimated Atari as well.

>Does anyone know if this is true? If so, how will people who buy
>CD-32's now be able to use photo-cd's once Commodore gets the license?

>Also, is the CD-32 CD-ROM player even multisession capable?

Yes, it's multisession capable. And the answer to the other question is:
get the PhotoWorx disk from Kodak.

>I don't think things will be much different for CD-ROM movies, they
>will probably release movies quite slowly. In fact, from watching the
>commercials that show off the MPEG movies, I'd say that only two are
>availiable - Hot shots and Plaes, Trains and Automobiles. Those are
>the only clips I ever see... :-)

Top Gun, StarTrek 7, Black Rain, and some other movies are supposedly
available in CD-V format *now*.

: ):#JC> employee, there are already 38+ games released for CD32. I have his
: ):#JC> posting saved if anyone wants confirmation...8-).
: ):#Not surprising .. kinda easy for developers to copy old games to CD ..
: )
: )So, I wonder how many catridge based Jaguar games will be ported to CD.
: )Same thing applies.

: But that's different - all of the Jaguar cart games are written
: specifically for the Jaguar, while the CD-32 gets ports of crappy old
: games which just crowd the market.

Like what games? Mortal combat is real and old crappy. Same goes with
nearly all the arcade conversions, because they're bound to be another
version out for some other platform.

When the Jaguar gets arcade conversions, I'm sure you're going to say
that it's just a crappy old conversion of something that a Gameboy
can play...

: How many games have even 1MB of code? That leaves you with 5MB to
: split between graphics and sound.

Nearly all the PC games have close to 1MB of code. They try to jam
everything up under the 640K limit. All the data and overlays are
left in extended ram. Same goes with a lot of Amiga games.

: Return to Zork is supposed to be a much more graphical game - it's
: already out I think for some other system (CDI?). I think they are
: also planning a CD release.

It's out for the PC CD-ROM's as well. Has gotten rave revues.

# 3380. Re: CD-32 is the next Edsel

Newsgroup: comp.sys.atari.advocacy
Date: 1993-12-06 01:32:07 UTC
From: kendall@great-gray.owlnet.rice.edu
Message-ID: <KENDALL.93Dec5193207@great-gray.owlnet.rice.edu>
Source record: 19975

In article <CHKA59.LDA@news.Hawaii.Edu> jimmy@Hawaii.Edu (Jimmy Chan) writes:
)In article <KENDALL.93Dec4173217@great-gray.owlnet.rice.edu> you wrote:
):#But that's different - all of the Jaguar cart games are written
):#specifically for the Jaguar, while the CD-32 gets ports of crappy old
):#games which just crowd the market.
)
)I hope you really don't believe that ALL Jaguar games will be all new games
)and not just ports. Even SEGA and Nintendo had their share of ports.
)Until there comes out a quantity of games for the Jaguar you don't know for
)certain what's going to be good and what's not.

True, but for the most part the Jaguar won't be getting as many ports
of games with poor gameplay. And personally, I doubt I'd by an SNES
port unless it offered better graphics or sound, in which case it has
been tailored for the jaguar... I guess that's really what I meant.
The CD-32 is getting a lot of stuff that is just A1200 or A500 games
dropped onto the CD.

)
):#But specs help a lot in determining the potential of a system.
)
)Potential, yes. Success, no. The other factors determine the success of a
)system. Beta had more potential than VHS but more videos were coming out
)in VHS format. Neo-Geo, had better graphics, but price and lack of games
)people were will to pay for, killed it. Remember the TG-16, same pretty
)much as the SEGA and Nintendo but, lack of software. NeXT, great
)interface, albeit too slow for me, DSP, great hardware but, price killed
)it. Now, look at the Clones, the potential is now there but, before the
)potential was there it still outsold every computer platform, why?
)Definitely, not because of potential. A host of software is what pushed
)the Clones to the top of the computer heap, regardless of IBM.
)
)Potential don't mean nothing without software. I don't see too many people
)buying systems with potential but no software. Of course, there'll always
)be those who just go for potential but that doesn't insure you'll get
)software.
)

That's true, but the Jaguar has enough big developers now that the
hardware potential actually means something - with enogh good
companies working on projects, some really good games that use the
hardware well are bound to arrive.

The problem I see with the CD-32 is that is has a much lower "upper
ceiling" on performance.

):#That's about it - I don't really think carts are better than CD's, but
):#for some games they are enough.
)
)Yes, for some games they are enough. I don't doubt that but for the games
)with mucho stuff, you'll need better than a cartridge. Even to get the
)most of the Jaguar you'll need to have a CD.
)

Perhaps, but I think enough quality games can be made on a cart to
make it worthwhile until the CD comes out. Also, if the CD breaks
down I can still play the cart games, and I also imagine that some
company someday will figure out how to make a cart+CD game that could
use the strengths of each medium to do a lot.

):#Return to Zork is supposed to be a much more graphical game - it's
):#already out I think for some other system (CDI?). I think they are
):#also planning a CD release.
)
)I wonder how much more graphical. I hope it isn't static pictures, like
)I've seen some other games do. I just asssuming this is the next phase for
)Infocom to go to after text based games but not necessarily true.
)

I think it is supposed to be fairly graphical - but I don't know too
much about it, and actually am not sure I'd buy it anyway.

):#There are already a few Jaguar CD developers, and others will come
):#along soon I'm sure.
)
):#Should I be worried that stefefan's company is waiting for Jaguar
):#results? Does he work for Microprose or something?
)
)His is only one company but this might be the current trend among the
)others. In today's market, developers tend to be a little more careful
)since a game that doesn't do very well could cost them big. This brings to
)mind why you might see a few ports to the Jaguar early on. It's more
)expensive to develop a new game to a new system than it is to port a game
)that's already exists on another machine and just convert it to work on
)another. Oh, doesn't that mean Return to Zork is a port?
)

That's true, but his company is not one that I miss a whole lot - what
concerns me more is the number of big developers latching onto the
system. Perhaps later I'll care more about the small companies.

):#I haven't heard anything other than here about the CD release being
):#moved up. I've heard they didn't want to release the CD right away,
):#but they were waiting a few months.
)
)Doesn't that amount to the same thing? The CD won't be released soon
)whether or not they moved up the release is unimportant. What's important
)is the CD won't be here for awhile as yet.
)

But I doubt I'll even be able to afford all of the cart games coming out as it is - I'll probably get Raiden and AVP, but I really can't afford much more for awile. There's enough cart games to keep me happy for awile...

)Will the Jaguar CD have FMV, PhotoCD, and whatever else is available?
)

Yep, that's the plan.

The jaguar is scheduled to include Photo-CD, and Cinepak out of the box. It will have an MPEG cart for the CD-ROM movies (not that I'd be so foolinsh as to buy an MPEG cart), and they have also said they will have an MPEG-2 cart for decoding movies broadcast over cable lines and such (i'm not so sure about this either, but it might have potential).

They don't all have to have NVRAM, some can use passwords (like all of the CD-32 games will have to).

I don't think there will be copiers for the Jaguar, it seems to me that the user agree you get when you purchase one makes the use of copiers illegal.

[stuff deleted]

|> Are you saying that the CD-32 that is out now CANNOT USE photo-CD
|> disks!!!

Hardwarewise it can (it's a multi-session CD-ROM too). Needs
the software. Thanks to CD-I's involvement in Kodak stuff, and some
Kodak criteria (main problem was that the CDTV originally could be
converted into a computer, so it's no longer 'just a player').

|> Every CD system out now (CDI, 3DO) can read photo-cd disks right out
|> of the box. The Jaguar CD will support Photo-CD.

Spare me the BS about the Jaguar CD-ROM. When it COMES OUT, then
I'll believe it.

The only thing ATARI has come out it in YEARS without having huge
delay problems, vapor that never comes to being real, etc. is the
Jaguar.

|> I know you have to
|> license photo-cd technology from Kodak, but I had just assumed that no

|>
|> Nah .... The Jaguar is *WAY* ahead of the CD32 ... the above mentioned are a
|> LOT closer ... (no need to enter the technicals, you will surely just argue
|> against anyway .. )

All depends... there's always a limit to cartridges...

|>
|> JC> Come off of it, even with JPEG compression, you'll still need room for the
|> JC> game code. Game coding will take a lot of room and JPEG compression
|>
|> Game code doesn't take a lot of room .. maybe 100-200Kb ...

But data does, particularly '24-bit' and '16-bit CD sound'.

|>
|> JC> doesn't do game code, right? So, expect less than 50 Megs, if the game is
|> JC> about 1-2 MB, from a 5 MB catridge, then you'd only get about 3-4 MB for
|> JC> the graphics, which is about 1:7 ratio as was given before about 21-28 MB

|> JC> of graphics. Then how about sound? Most of the CD32 stuff has CD music,
|> JC> which is what's taking up about 100 MB or so. Even the 3DO stuff will
|> JC> have
|> JC> CD soundtracks to improve the play.
|>
|> How big is a module?

8-voice CD quality module? Must be big...

|>
|> JC> Don't forget CDs are cheaper to produce for a larger base. If you're
|> JC> going
|> JC> to have a smaller base of users then a catridge based system is better,
|> JC> but
|> JC> for a larger market, CDs are way better than catridge any day. If you can
|> JC> tell me why a catridge is better. Other than having a faster load time.
|>
|> The system itself is cheaper.

On the other hand, if the 6 MEG cartridge ROMS cost about $100....

|>
|> JC> Why would that be on CD by itself? You can fit all the Zork games plus
|> JC> all
|> JC> the other damned text-based games onto a CD. Hell, why bother? I've
|> JC> never
|> JC> bought a text based game since Zork I on my C-64. Even if Return to Zork
|>
|> SHEESH .. Return to Zork ... *TEXT* .... geezuz .. yes, maybe -85 ... but the
|> Return to Zork developed now NEEDS a CD-ROM .. GUESS WHY ...

Which is why it will never see a Jaguar cartridge release.

|>
|> JC> If a game developer was to develop for the Jaguar CD, they'd have to put
|> JC> money up front to become a developer, purchase the necessary equipment to
|> JC> program for it, start learning how to program it, take months to develop
|> JC> the software for it and then wait more months til the CD player comes out
|> JC> before they start seeing revenues coming in? Don't know of many companies
|> JC> that can do this. Even Stefan's company is taking a wait and see attitude
|> JC> towards the Jaguar, and they are already committed to the CD32.
|>
|> Hey .. surprise .. there are a LOT of Jaguar developers .. and some are doing
|> CD right now ... wake up ..

CD-32 has far more developers, although recently the Jaguar finally
got a couple of decent developers.

|>
|> JC> Atari's attitude towards having a CD available for their console might end
|> JC> up to be a bad move on their part. I don't know if what I keep reading
|> JC> hear about Atari's moving their CD release date so, they could have more
|> JC> titles ready for the CD launch is true or not but, if this is so, I'm

|> JC> beginning to wonder if the number of games available for the CD launch
|> JC> will
|> JC> be the same number of games listed for the Jaguar debut.
|>
|> Very strange that Sega will do the same with their Saturn systems ... but I
|> guess Commodore is a lot smarter than Atari and Sega together, right?

A lot smarter than Sega- no. Than Atari probably. Hey, look at the
'huge' number of Falcon's sold!

|> "add a CDROM player" ... idiot ..

Idiot you. IF the Jaguar CD is any good, you have to add that cost.
It surely influences that the starter unit is cheaper though, but look
at the other side too to be objective...

|>
|> JC> Okay, since I put up a list, you want to show me what developers there are

|> )

Rickard, BOY DO YOU BELIEVE EVERYTHING YOU READ!

>>>>>>>>>>>>>>>>>>>>>>>>>>> HEAR THIS!

SGI AND NINTENDO HAVE NOT BROKEN ANY DEAL!

SGI actually has an add looking for game/developer and software
engineers for the new machine.

It appeared on 'EDGE' magazine, but someone already checked out that
IT WAS NOT TRUE.

|>
|> Atari knows that US is the best market to sell a console in ... (especially

PFfffttt! Make me laugh Rickard! (hint: I am 'in America').

|>
|> Phillips hasn't made a console - the CDi was never intended to beat the crap
|> out of the console-market.
|>
|> 3DO is a flop. (remember the MSX computer standard?)

It might, particularly at that price. But who knows, the Jaguar
can be a flop too... after all, the Falcon did.

Why not? The CD-32 has an expansion port. They could put another
CPU right there...

|>
|> One thing I've been thinking of ... the FMV module for the JagCD will probably

|> make a cheap FMV cartridge that uses the Jaguar instead of external chipsets
|> ....

Dream on. Video CD requires an adapter for the Jaguar.

|>
|> Anyway: What graphicsmode is the CD32 using for its FMV?

The Video CD standard based on the MPEG-1. This is real-time 30fps,
352 (not 100% sure, maybe it's 340 or 320)x2 (extrapolated, like the 3DO stuff)
by 4xx lines (I think it's 400).

The graphics are supplied by the FMV module, and CD-32 graphics can be
overlayed on top of the MPEG module graphics...

|>

Well, get pissed ;-)

Kendall, C= and ATARI, *both* are VERY INCOMPETENT.

One of the main reasons why I am so skeptic about everything
made from ATARI lies in PROOF.

What is their past track record?

* ST CD-ROM that never got released

* Hype hype hype

* Pen computing computer that never got released

* The Atari Lynx- good piece of hardware that didn't sell well

* The Falcon

How am I supposed to believe all of a sudden that the Jaguar would
be any different?

I has potential, and ATARI *seems* to be doing the right moves...
that's one thing...

But again, one thing is racing half the race and make it to the
goal, and another is racing half the race and come out in the last place.

I agree.
You see lot's of VIDEO titles, because people rent videos. You don't see LD titles because those are not rent but bought (mail-order). I won't buy many movies on video. You watch them 5 times and have already dropouts.

Georges.

They already have this with LD along with much higher picture quality than either
VHS or CDi/FMV/whatever have any hope of meeting in the foreseeable future.

Best way is to sell the Photo-CD software on a Cartridge. So you don't have to insert a CD to load the soft, and then the Photo-CD with your pictures.
On a CD-only system you will have to swap CD's if the software is not in the box.

>

But you're using the same amount of memory as a 16-bit video screen to do
the HAM8 animation.

This means (at the minimum) while you do have lots of colors to work with,
you still won't be able to fully utilize the "feature" of saving memory
and/or bandwidth because:

1) you are being forced into a 640xXXX mode to have finer resolution for
moving objects.
2) you are using a screen that is physically twice as wide as one that could
do the same level of "smooth" animation (i.e., a Falcon truecolor screen).

The advantage of the HAM8 mode would be that it would be possible to have more than 65536 colors on screen at once, and animate them.

The disadvantage would be the added expense/effort of making sure that all sprites, bobs, etc... conformed to this "every odd scanline" scheme, and you would never be able to have "fine" movement from a pixel to another pixel on the x axis.

It's not a "bad" thing, but I think it is probably harder to develop a game that has to manipulate the screen data in HAM8 than it would be to do one for TrueColor on the Falcon, for example.

>|>
>|> Why not just use a natural 16-bit display? For animated sequences, I think
>|> the difference between HAM8 and the Falcon's 16-bit true color display

>
> NOPE, IT WON'T!
>

Well, I don't agree with this one. For one thing, since we haven't seen any HAM8 and Falcon ports of the same games... it's kind of hard to say. I have seen both machines, and I think the difference wouldn't be too phenomenal, and on the base machines, I think the speed of the Falcon might give it an advantage.

>
>|> and the Falcon's display would have the advantage of

>how the anim format works in my machine every day!
>

But that is an animation that is working from global data. Plus, as you said before, most animation/paint programs use a 24-bit image internally so they would never need to do any of the things you've mentioned. If they didn't use the 24-bit method, they would be "lossy" in HAM8...

> We were talking about having BOBS or Software sprites pasted using the
>blitter and/or cpu. I just mentioned a scheme for avoiding heavy CPU time
>and calculations of remapping the 64 registers.
>

Ok. These are interesting methods... it just seems that the HAM8 programmer is doing a lot to achieve the same effect that could be done much quicker in in a "normal" video mode.

(and I think it probably wouldn't do much for the speed of the game if the CPU ever had to get involvd in the processing)

> About animation:
>
> * Remember: no problem at all because for the AMIGA, HAM8's memory
> looks just like an 8-bit plane memory. Animations
> operate by doing delta's and storing them quickly
> in those bitplanes.

If HAM8 is strictly like 8 bit plane memory, then... this is where you need to explain something: what happens if the request for a specific 8-bit value for a pixel is not possible? Does the pixel wind up being altered from the original requested color value, or what?

I can't see how HAM8 can be treated like a "normal" 8-bit video mode when 2-bits from each pixel may carry over (i.e., you may be able to act like a "normal" 6-bit video mode... because the 2-bits carried over from the previous pixel could be ignored).

>
> You HAVE NO color fringe in animations that have been
> pre-calculated.

Ok, but a videogame (or anything interactive) wouldn't be precalculated.

Are the BOBs limited to only 64-colors each, or what? I read your explanation and the one thing that I still haven't caught yet is whether the image can contain more than 64 colors... and if so, doesn't it appear blocky because every other pixel (horizontally) is either derived from the previous pixel, or a base color?

I've played both machines, and I have to say this: 3DO is the better
machine "out the box" because you get tons more of goodies. The hardware
on the 3DO is also demonstrated a lot more by the demo disk and Crash 'N
Burn....

However: I did see Crescent Galaxy (well, a beta of it) and it looked great
but the sound wasn't complete. The Jaguar is indeed capable of 3DO-quality
visuals, but I think it is just not shown off in Cybermorph.

(which incidentally, is more fun than Crash 'N Burn if you're into Starglider
type of games.. and the enemies are great... )

The BOBs need only have a base color as the leftmost pixel of each non-transparent horisontal line (or part of line in case of concave BOBs), if the BOBs are guaranteed never to be placed on top of each other.

I admit that HAM8 is not suited for all games due to the complications it presents, but maintaining a HAM8 scrolling playfield will be a lot faster than maintaining a 16-bit TrueColor one (if you are not to have the whole bitmap in memory, which will be very memory-consuming in the 16-bit case, but not so bad in the HAM8 case). And you can use the sprites for some nice effects on top of it.
I am currently thinking of a racing game, where the cars leave tracks on a larger-than-screen scrolling background in HAM8. The tracks will be implemented using six 64-pixels-wide low-res sprites totally covering the screen and smoothly scrollable with the same speed as the background, and the two competing cars will have one sprite each. The background will be heavily animated.

Just think about it! - Kristofer.

The bitmaps would indeed be smaller, but what I'm wondering about is whether
there is added effort in creating bitmaps that conform to this or not... and
how much coding is required to do what has been described.

(it sounds quite feasible, just tough to develop for)

(crossposted from c.s.a.misc)
#7409 comp.sys.amiga.advocacy 5k
From: kar5@po.CWRU.Edu (Kevin A. Roll)
Subject: WOC, Lew Eggebrecht's talk
Date: 5 Dec 1993 06:50:25 GMT

Ahh, hard to believe that eight hours ago I was standing in the midst of the World of Commodore Toronto... I took some notes during Lew Eggebrecht's keynote address, here's what I thought was important. A lot of what he said was old news as far as technical information, but there were some interesting points.

The first part centered around CD32. As Darryl already reported, they have just started making the NTSC units, and only had a few for the show. Apparently half of the shipment got delayed at Customs. Lew reported that CD32 is the number 1 selling CD platform in Europe. He also said that there are 120 licencees developing titles, and that Commodore has spent absolutely no money subsidizing any of them (as they did with CDTV). I think this is very good news.

Next, he began to talk about the MPEG module, and how there are two standards - Video CD and Philip's standard. He then stated that C='s solution was to play them both, which brought a round of applause! The FMV card is in production, with 2000 units expected by next week (kiss my ass Barrett). The first round are all going to France, where they have a guarenteed order for some large project (this last bit overheard from a rep on the floor).

The discussion then turned to the AAA chipset. As previously reported by C= employees, the first silicon has been made. Lew stated that it has > 95% functionality already, and is "darn close" to completion. The wonderful 24-bit images are being blitted with incredible speed. He said that all 4 chips have tiny bugs that are being worked out. In the next 2 weeks, two of the chips will go for second-pass silicon, with the other two being sent by the end of January. Systems based on these AAA chips will be released on a time schedule dependant on the performance of the second-pass silicon. He hoped that this would mean around next fall.

As far as the systems go, Lew *confirmed* that the Intel PCI bus standard has been chosen. This will allow a processor-independent architecture, with the 68060 first and then an undetermined RISC processor later.

In other news, a cost-reduced version of the A4000 has been engineered and released to manufacturing. Also, C= is pushing hard on the A4000T to get it going. C= is working on the CD-ROM drives for the 1200 and

4000, with the 1200 having priority. Lew said that the 1200 would be internal, and the 4000 would be a Zorro card + external drive. The clincher was that the 4000 version would include the FMV card! He anticipated these models being available next spring. Someone asked about the DSP technology - Lew indicated that it had been licensed out, but that it would be on the motherboard of the AAA systems. Also, as previously stated, AAA sound will be 8-voice, 16-bit, 100kHz sample rate.

Lew then really freaked me out by telling us all that C= is already looking *beyond* AAA. Their goal is to do real-time 3D rendering, with a target of 30 million pixels/sec. To do this, they are designing their own 3D pipeline scheme. This is serious Silicon Graphics territory, and I was amazed to discover they are planning this.

Someone also asked about Photo CD. Lew said that a license had been arranged with Philips, but not executed yet. Development is underway, and something will be out after the 1st of next year. The last question was the eternal, "will there be a laptop Amiga?" Lew said there are no plans for now, but as the AAA chipset is entirely CMOS, it lends itself much better to that sort of thing. Now if they can get a 24-bit LCD...

As far as my initial impression of CD32, I thought it was great. The demos and games they had available were certainly exciting. They had the dinosaur morph demo that has been previously described, the flight demo, and four games to be played - Pinball Fantasies, D/Generation, RoboCod, and something else I forget. One other machine was playing a football game, and an MPEG machine had a really cool game going whose title I never heard. It was like a Fantastic Voyage theme, with the player cruising through an artery blasting stuff.

The MPEG stuff they showed during Lew's talk was excellent. They had about a 15-foot screen set up, and the clarity was brilliant. They were using the Paramount Star Trek 6 CD for a demo, and it looked great. They also showed the European commercial with the exploding robot, which brought another tremendous round of applause.

Overall, the show was lots of fun. Commodore is certainly not dead, and the CD32 looks poised to take off like a rocket. Throw in Zool, the Ninja from the Nth Dimension dancing to the techno coming from Newtek's booth (Toaster is God, repeat after me) and you have a recipe for fun. Also, I won a free CD from SunRize and one of the PD houses had my game for sale. Well, I'm babbling now so I'll conclude.

While you are correct that both are good systems, and both are much
better alternatives to Intel based machines. However I fear that this
is really a religious war, and I don't think this will end in less time
than the religioyus conflicts of the Middle East :(.

But it is a nice thought...

I don't know about that - they've made good on every promise for the Jaguar so far, which I think signals a major shift for them. I see no reason for them to divert from the present course.

)|> Apparently I did!!! This is a major annoyance to me, it appears that
)|> the photo-CD support will be optional for the Jag CD as well. Boy, it
)|> better not cost more than $50 or I'll really be pissed!!
)|>
)
) Well, get pissed ;-)
)
) Kendall, C= and ATARI, *both* are VERY INCOMPETENT.
)
) One of the main reasons why I am so skeptic about everything
)made from ATARI lies in PROOF.
)
) What is their past track record?
)
) * ST CD-ROM that never got released
)
) * Hype hype hype
)
) * Pen computing computer that never got released

Thank god after seeing the newton - the technology needs a year or two.

)
) * The Atari Lynx- good piece of hardware that didn't sell well

You heard it here first - I predict an amazing Lynx comeback tied to the Jaguar's success. I think a major reason the Lynx had trouble was no console tie in to instill loyalty.

)
) * The Falcon
)

Hey! I love my Falcon (not carnally, for the picky among you).

) How am I supposed to believe all of a sudden that the Jaguar would
)be any different?

Well, because they really have been doing different things. I only
ordered my Jaguar after I saw that they were actually advertising (A
real physical Gamepro ad that I could touch), and had good press
coverage - that plus the developers they've signed up convinced me.
I've never seen anything like this for the computer line.

As for the ST CD, well you can just get any 'ol SCSI CD-ROM and hook
it up to an ST. True that there are not a lot of ST specific CD-ROms,
but I can use photo-CD, or DTP CD stuff.

)
) I has potential, and ATARI *seems* to be doing the right moves...
)that's one thing...
)
) But again, one thing is racing half the race and make it to the
)goal, and another is racing half the race and come out in the last place.
)

But Atari's off to a good start in this race, instead of sitting at
the gate trying to tie their shoelaces like the usually do.

From: paradox@maynard.chi.il.us
Message-ID: <CHn0E4.MC@maynard.chi.il.us>
Source record: 19764

What's this big deal about the Jaguar and its current lack of a CD-ROM? Who cares? The Jaguar cartridges provide better speed, and look at how the Sega CD turned out. It turned out so that there aren't ANY good games for the system that really couldn't be done on a cartridge! The only decent game, Sonic CD, could have been the exact same game (minus the intro cartoons) on cartridge format, and you wouldn't have to sit through the access time! CD-ROMs, except for on computer, are really over-rated. Watch the other CD systems die, they're either too expensive or just don't have a big enough audience. The general gaming public (thinking of the teenagers) couldn't care less about the CD32, it's not Nintendo or Sega so "it's no big deal." The Jaguar has to be put into their little minds but I believe that many are catching on to how cool it is, and "it's only $250!!"

All the other CD-ROM systems have not shown much in the way of software, so why can't Jaguar be any good without one?

Tim Johnson

Here's something even funnier:

There are *ZERO* CD-32s in the United States of America.
There are at least 50,000 Jaguars. All sold.

I would say that means the Jaguar is 50,000 times better, but hey:

50,0000 x 0 still equals 0.

:)

Meanwhile, there are now 520,000 CD^32 units *SOLD* in Europe. Jaguar units?
Perhaps 500-1000.

You lose. Atari loses. Guess who wins? Hint: Starts with A, ends with "miga".

That's nice. For Europe.

Remember, the TurboGrafx/16 had an (allegedly) insurmountable lead for some
time in Europe.

Or so everyone said.

What ever happened to them?
```

:)

Plus, to be quite honest, it doesn't matter what sells good in Europe if the
product isn't available here for me to see and/or buy.

Of course, you apparently believe in "mind over matter":

You don't mind not seeing a system first, so how bad it sucks doesn't matter.

:)

>laserdisk technology!!

Well, I never said MPEG-1 was better than SVHS, I said it was better than
VHS. To be honest, I've never seen a SVHS VCR, but I do have a higher-end
Hi-Fi VHS VCR, and the image and sound quality is excellent (i.e. good enough
for me).

Doofus, that's 50000 sales to RETAILERS. Quite a difference
between sales to end consumers. Unless the Jag has magically
sold every unit within the last week, when my local _ATARI DEALER_
was _STILL_ waiting to get them in.

Give me a break..

Jon

>Now please tell me why this system will sell! (CDTV!)

It will sell because people want it. It's sold exceptionally well, as a
matter of fact. Some friends of mine made a game for the CD32 called "Pinball
Fantasies", which has sold between 40,000-50,000 copies on the CD32 already.
That's *very* good sales figures, and it means people will continue developing
for the machine.

>JC> Your way ahead is a bit distorted. It doesn't come with a CDROM drive,

>Jaguar is way ahead of the CD32. (Atleast you usually tell the truth .. :-)

None of the systems are ahead of the other in all areas. The fact that
the Jaguar uses cartridges is a great disadvantage. Not only because of
the space constraints, but also because of the production costs. On the
other hand, the Jaguar has an edge in the graphics area, with it's object
processor and higher processing performance. I wouldn't say either was
better than the other - they are good at different things.

>You do know that SGI has broken whatever form of deal they had with Nintendo?
>(Nintendo will probably go back to the 32bit (old!) system they had in mind ..

They have not. That was just a false rumour.

>3DO is a flop. (remember the MSX computer standard?)

I remember MSX, but it's still much too early to draw conclusions about
the success or failure of 3DO.

About 15 months ago, when the AGA Amigas and Falcon was both released,
this group was filled with posts about how the Falcon would stomp all over
the A1200 and A4000. Funny how things change.

>RH> That isn't what Stefan said....

>Then what did Stefan (the all-so-mighty Amiga-GOD) say?

Don't know about the god thing, but what I've said (paraphrased from
Atari press release material) is that the JagCD will not view MPEG,
Photo-CD etc. out of the box - you will have to buy a cartridge.

>RH> Why not? The CD-32 has an expansion port. They could put another
>RH> CPU right there...

>Can you hear the words .... EXPENSIVE .... being screamed?

Several SEGA and SNES games have dedicated processors on the cartridge
(Virtua Racing, StarFox/StarWing), and they are expensive, AND they sell.

>RH> Dream on. Video CD requires an adapter for the Jaguar.

>I wrote that, but I also wrote it should have the CPU power to do it on its
>own if someone tries.

I doubt it. My 25MHz 68040-based A4000 doesn't even decompress a 160x120
pixel MPEG animation at more than 11 fps. A FMV animation is four times that
size, and the Jaguar does not come near the computing performance required.

>RH> The graphics are supplied by the FMV module, and CD-32 graphics can be
>RH> overlayed on top of the MPEG module graphics...

>I can repeat the questions if you have problems reading:

>What graphicsmode is the CD32 using for its FMV?

You're the one who's got problems with the reading. The CD32 does not
render the graphics internally - the FMV module renders the MPEG stream
to it's own framebuffer, and the CD32 video can then be superimposed on
this (genlocked, basically). Same deal with sound.

|> advantage.

Nope, ABSOLUTELY NOT!

Remember two things:

* Ham8 chooses colors from a 24-bit palette
* Falcon's 68030 has a 16-bit datapath. Operations
such as decompressing an animation to memory where
you have to move data will 'hamper' the data cache perf.

This is what I understand by animation, when you said it though.
Alghouth I'll like to see what you mean by global data exactly...

|> Plus, as you
|> said before, most animation/paint programs use a 24-bit image internally

When you are painting.

|> so they would never need to do any of the things you've mentioned. If they
|> didn't use the 24-bit method, they would be "lossy" in HAM8...

No problem in animations. I use dpaint and others with no problems.
Now, maybe I am misunderstanding the type of animations that you mean.

|> > We were talking about having BOBS or Software sprites pasted using the
|> >blitter and/or cpu. I just mentioned a scheme for avoiding heavy CPU time

|>
|> Ok. These are interesting methods... it just seems that the HAM8 programmer
|> is doing a lot to achieve the same effect that could be done much quicker in
|> in a "normal" video mode.

True. But then remember that there are utilities. I already thought
about an simple AREXX script that would create the graphics from me,
using a 24-bit image using ImageFX.

|>
|> (and I think it probably wouldn't do much for the speed of the game if
|> the CPU ever had to get involvd in the processing)

The CPU hasn't, like I said before. BTW, maybe even 320 in x can do
the job. Remember the 8-bit computers? The sprites moved in '160'
pixel type resolutions, yet they looked smooth.

|> > About animation:
|> >
|> > * Remember: no problem at all because for the AMIGA, HAM8's memory

|> > in those bitplanes.
|>
|> If HAM8 is strictly like 8 bit plane memory, then... this is where you need
|> to explain something: what happens if the request for a specific 8-bit
|> value for a pixel is not possible? Does the pixel wind up being altered
|> from the original requested color value, or what?

It would be altered, you'll have to kind of either calculate, or keep
track of it. But what this have to do with delta-compressed animation?
Remember that all you do is decompress a bitplane information, and
the information gets to the screen memory.

THIS IS exactly what you do on other computers, regardless of
video type and memory video requirements. It works the same.

|> I can't see how HAM8 can be treated like a "normal" 8-bit video mode when
|> 2-bits from each pixel may carry over (i.e., you may be able to act like
|> a "normal" 6-bit video mode... because the 2-bits carried over from the
|> previous pixel could be ignored).

AGAIN, for playing back animations, there's no problem. Remember that
when you decompress the bit-plane information, you are decompressing
the screen in exactly the same state it was in the original picture.
So what happens is that all the colors 'fall into place' perfectly (those
that are dependant of the color of the pixel to their left)

|>
|>
|> >
|> > You HAVE NO color fringe in animations that have been
|> > pre-calculated.
|>
|> Ok, but a videogame (or anything interactive) wouldn't be precalculated.

True, but that's why I described the method in the original posting.
You can make easily action games that way (except drawing the graphics,
but again, utilities are made for something ;-) ).

Sorry that I confused you. Using a scheme that I posted before
you can use more than that.

|> I read your
|> explanation and the one thing that I still haven't caught yet is whether
|> the image can contain more than 64 colors... and if so, doesn't it appear
|> blocky because every other pixel (horizontally) is either derived from
|> the previous pixel, or a base color?

I have to do the ImageFX script and take a look for myself, but my
prediction is that it won't.

If you have a good 64-color base palette, remember that a lot of
colors are precisely variations to the of intensity or hue to the color
on the left in a lot of images (shading, etc.).

And the effect can be further improved by using copperlists, so
every horizontal line you can have at least 32 new base colors...

I admit I have to try it, to see how good it can look.

Kendall, the problem is that ATARI has a lot of times 'showed'
promise and has come out pretty short.

Listen: I am not saying that they are not going to make it...
I always allow for change, what I am saying is that
I am a bit skeptic, and that I got reasons to be...

[stuff deleted]

I am comparing with LaserDiscs. Now, I admit, they have to be
somehow much more attractive than a VHS...

|> Thank god after seeing the newton - the technology needs a year or
|> two.

You can mock Apple all you want, but a friend of mine has it
and it works for a lot of things. Did you know the US government
is giving Apple $1 million just to validate Newton technology
for the Department of Defense for medical use?

And if they do validate, just $$imagine$$ how much they'll make.

ATARI had a chance... and let it pass.

|> ) * The Atari Lynx- good piece of hardware that didn't sell well
|>

|> coverage - that plus the developers they've signed up convinced me.
|> I've never seen anything like this for the computer line.

True, but ATARI has to come out with software and support.

And they pack in in a $250 machine a switch box which is not
automatic, don't put a dust cover in their cartridge port, have
a couple of RF interference and no cables for stereo sound...

You know what I mean? But I agree, they are doing a lot of
different things, which is why I GIVE THEM A CHANCE. It doesn't
guarantee success, and it doesn't mean I don't have the right
to be skeptic.

|>
|> As for the ST CD, well you can just get any 'ol SCSI CD-ROM and hook

# 3439. JAGUAR INFO - HOT OFF THE PRESS

Newsgroup: comp.sys.atari.advocacy
Date: 1993-12-08 01:29:19 UTC
From: davidh@iowa.viewlogic.com
Message-ID: <CHp04w.E2@viewlogic.com>
Source record: 19870

December 7, 1993

Today's San Francisco Chronical quotes Sam Tremel saying (from England) that they only shipped 3,000 units to date out of a total run of 30,000 (not the originally planned production of 50,000). They stopped shipping when they discovered RF shielding problems with their cable/connector. Tremel says that they`ve fixed problem, and shipments will begin again now.

My nine-year-old son has been driving me crazy for a Jaguar and I put a $25 deposit on one at the Good Guys retail store. They had an initial shipment of 25 units per store and sold them out before they came in.

I'm sure that all 30,000 initial units will be snapped up in a couple of days.

d. Heller

I'm amazed you're still waiting. Everyone around here who had any in stock
has sold out.

Of course, if you were really smart, you'd have realized that those 50,000
were intended for just NY and SF and wound up also floating from retailer
to retailer across country because of (gasp!) high demand.

Captron's World of Nintendo (which ironically sells Sega and Jaguar and 3D0)
had several in stock at two locations.

They were claimed within 3 hours of being in stock by people who waited for
them.

Right now, I can see a Jaguar every day in person. Can you see a CD-32?

(unless you're in Europe, I guess not, and if it ain't here... it ain't here)

Sounds like a lot of tricks to do something that is really quite simple if
you have enough pixel depth. I guess what I'm getting at is, sure it's
possible to do a HAM8 game, but... well, how many HAM games were there?
(when I was last checking into games at all, it was 1990 and there was 1 or 2
after 5 years of people working at it... sure HAM8 is a different beast, but
the concept is similar enough that I'm nto sure we're going to see it do
any better...)

> * Ham8 chooses colors from a 24-bit palette

That is a bonus. However, it cannot select freely from that 24-bit palette.
It can (at best) choose one of 64 pre-selected colors that WAS chosen, OR
it is forced to pick from one of 2^6 possible unique values FROM the 24-bit
palette. To make it look nicer, you could write an algorithm (which would
require CPU time) to aid in deciding how to deal with the 2 bits carried over
from the previous pixel, but.. the net effect is, you never can choose from
more than 4096 colors with total freedom froum that 24-bit palette for a
given pixel.

> * Falcon's 68030 has a 16-bit datapath. Operations

You walked right into a Motorola 56001 DSP with 32-bit datapath to memory
and running along at 33mhz. Why would you use anything else for such
a task? and since it runs concurrently with the 68030, I would really
have to say that it would be absolutely impossible for an Amiga 1200
that is "out the box" or even with fastRAM to decompress an image any
faster.

(for verification, check out how fast the JPEG algorithm runs on the 56001
on the Falcon... I remember a while ago someone posted a benchmark showing
it outperformed some '040 machines on that task...)

Has any tried to use the program Solutions developed by Elan Software of Quebec Canada? I am a computer engineering student at UNB and I was wondering if purchasing this program will allow me to do complex number calculations, bode plots, polar diagrams, Laplace transforms, matrix calculations, etc. Is this program similar to El Cal (The Math Machine)? Does anybody have any other software they would suggest for a computer engineer?
a

Rickard Troedsson (rickard_troedsson@troed.ct.se) wrote:
:#Fact:

How can it be a fact if it hasn't happened as yet? I guess you mean opinion.

:#The AmigaCD32 will have PLENTY of games ..... OLD GAMES ..... GAMES NOT USING
:#AGA GRAPHICS ... GAMES SMALL ENOUGH TO FIT ON 2-3 DISKS ...

Yes, the CD32 will have PLENTY of games, didn't you know if you don't have
software you can't sell machines. Oh there is no doubt from me that games
on the CD32 will be OLD, and non-AGA, small enough to fit on 2-3 disks
that's depends if you take out all the extras. But, with all of these
you'll still find a lot of CD32 specific stuff, even the ports will have
extras that cannot be fitted onto 2-3 disks, unless we're talking hard
disks.

You can say that Jaguar games will all be Jaguar specific all you want til
you're blue in the face but it doesn't make it true. A lot of Jaguar games
will be ports from other machines. Even your acclaimed 'Return to Zork' is
a port. But, of course you can't play it til you get a CD, what about 9
months from now. By then, it'll be an old game for other consoles with CD
units.

:#Now please tell me why this system will sell! (CDTV!)

Software. The reason why the Lynx isn't selling.

:#JC> Try reading the sentence again. I didn't say anything about Jaguar
:#JC> specific. Just what I've been saying all along, Jaguar catridge games
:#JC> will
:#JC> be ported to CD.

:#SO? That's NOT the same thing as A500/1200 games being copied to a CD, like you
:#said!

Why are you bringing in A500 games? The Amiga CD32 is just an A1200 with
CD, controller and Akiko chip minus some pheripheals like keyboard, mouse, etc.
How is it any different from moving an A1200 AGA game to the CD32 vs Jaguar
catridge to Jaguar CD? Isn't this just porting in another sense?

:#JC> Of course, you don't have any guarantee that some of the Jaguar catridge
:#JC> games wouldn't be ports. All platforms have had ports of games, what
:#JC> makes
:#JC> the Jaguar so special that it wouldn't, of course if it doesn't have
:#JC> ports,
:#JC> I won't be expecting too many games.

:#SO? That's STILL not the same thing ...

How isn't it? You don't give any basis for your argument. Gee, I give a
reason and you say it's not with nothing to say why it's not. Are you
still going to pull the kiddy type of arguments on a worldwide newsgroup?
(I'm right ... no you're not ... oh yes, I am ... oh no, you're not....)

:#JC> Your way ahead is a bit distorted. It doesn't come with a CDROM drive,
:#JC> what's so way ahead with a catridge? It doesn't have any software except
:#JC> for what it came with. We should have seen some by now.

:#IF you can't read tech-specs, why did you even answer that?

CDROM is the present and future. Cartridges are old.

:#STEFAN, people seem to listen to what you say, please tell this guy why the
:#Jaguar is way ahead of the CD32. (Atleast you usually tell the truth .. :-)

So, if Stefan says otherwise you'll agree? This, I gotta see.

:#JC> :#The system itself is cheaper.
:#JC>
:#JC> Pffffttt. Add a CDROM player. You can keep deluding yourself with this
:#JC> foolish idea. If this is the best argument you can come up with then why
:#JC> do you even bother?

:#Bloody idiot ... you asked why a Cartridge base system was better ... I said
:#the system was cheaper .. that's something parents will like ... your answer
:#"add a CDROM player" ... idiot ..

Let's see if you buy a car without an engine w/ all kinds of other doo-dads
for $1000. But, I buy a car with an engine for $2000, who makes out? I
get to drive you get to play with your doo-dads. Like I said, Pffffttt.

:#JC> Okay, since I put up a list, you want to show me what developers there are
:#JC> and how many CD developers there are? Come on any list will be fine.
:#JC> I've
:#JC> yet to see any sort of list of developers. Remember just because they
:#JC> signed up don't mean they are actively developing for it. I've seen
:#JC> Atari's so called marketing gimmicks before.

:#You haven't seen a list of developers? Then why are you running around with a
:#blindfold .. it's been posted several times already ...

I haven't seen any list since I started reading this newsgroup a couple of
weeks ago, latest our newsreader keeps things. Sorry, I don't spend ALL my
time here.

:#(I can't add textfiles to my letters in this editor, I'll post in right
after)

Okay, I really would like to see a list.

:#JC> Yep. C=, Phillips, 3DO and even SGI must know something that Atari and
:#JC> Sega don't. I still don't understand Atari move to release the Jaguar in
:#JC> the US, when their strength and popularity lies in Europe.

:#You do know that SGI has broken whatever form of deal they had with Nintendo?
:#(Nintendo will probably go back to the 32bit (old!) system they had in mind ..
:#Atari knows that US is the best market to sell a console in ... (especially
:#since it's "Made in America" - that alone will sell units!)

"Made in America" doesn't seem to be helping the electronics industry or the automotive industry. I've never believe that slogan anyway, I'll buy whatever is the better and cheaper, regardless of where it's made from.

:#Phillips hasn't made a console - the CDi was never intended to beat the crap
:#out of the console-market.
:#3DO is a flop. (remember the MSX computer standard?)

Phillips is already retargeting their console. 3DO is yet to be determined to be a flop. Oh, and I did read up on the Sega "64-bit" Saturn. It seems they'll be introducing two models, one with a CD/cartridge and one cartridge based only. They are still figuring out if they'll release the "32-bit" Saturn or upgrade it to "64-bit" then release it. It doesn't seem Sega is stupid after all, just good marketing sense.
Oh, did you hear of the DUO, that also comes with a CD player. It's floundering right now though, not enough software.

:#In article <CHKA59.LDA@news.Hawaii.Edu> jimmy@Hawaii.Edu (Jimmy Chan) writes:
:#)I hope you really don't believe that ALL Jaguar games will be all new games
:#)and not just ports. Even SEGA and Nintendo had their share of ports.
:#)Until there comes out a quantity of games for the Jaguar you don't know for
:#)certain what's going to be good and what's not.

:#True, but for the most part the Jaguar won't be getting as many ports
:#of games with poor gameplay. And personally, I doubt I'd by an SNES
:#port unless it offered better graphics or sound, in which case it has
:#been tailored for the jaguar... I guess that's really what I meant.
:#The CD-32 is getting a lot of stuff that is just A1200 or A500 games
:#dropped onto the CD.

Actually, if you look at it this way, any game that gets ported will have to be tailored to run under its new environment. Same goes for CD32 or the Falcon or the 3DO. Now, the amount of tailoring that is done is debatable. Ports can be done very well or done very badly. Same goes for titles that are created specifically for that machine where they can be done very well or very badly. It's true that the CD32 is getting a lot of stuff from the A1200, but the CD32 is an A1200 at heart. This is what Rickard T. can't seem to understand. If it is already tailored for an A1200 then the least the developers will do is one of the following to bundle it with other A1200 games, include CD soundtrack, add levels, etc. or some of these or all of these.

When the Jaguar CD becomes available, the developers will most likely take games from the catridge but include the same thing in the previous paragraph, you'll have extras added.

There are a lot of games I would like to see ported that I have yet to play. Even if they are old games, I wouldn't have played it as yet so, it'll still be new to me...8-). I'd rather have a large base of software to choose from, good and bad, new and old, rather than a small base of software with only new stuff and possibly all good. I'd like to choose what I can play rather since not everything that comes out suits my taste.

:#That's true, but the Jaguar has enough big developers now that the
:#hardware potential actually means something - with enogh good
:#companies working on projects, some really good games that use the
:#hardware well are bound to arrive.

I agree here but the problem I have with the Jaguar now, is that it doesn't come with the CD. With the CD, developers wouldn't have to worry about trying to fit it into a smaller cart, and they'd have a whole CD to play with to push the machine to its fullest.

:#The problem I see with the CD-32 is that is has a much lower "upper
:#ceiling" on performance.

8-). I see the CD32 with a much wider choice of options, though. I not sure yet about the 3DO though, it has a lot of potential but, potential doesn't always cut it, I'm waiting to see what their # of units sold is and the number of software that's actually seeing daylight. The same can be said of my feelings for the Jaguar too.

:#Perhaps, but I think enough quality games can be made on a cart to
:#make it worthwhile until the CD comes out. Also, if the CD breaks
:#down I can still play the cart games, and I also imagine that some
:#company someday will figure out how to make a cart+CD game that could
:#use the strengths of each medium to do a lot.

I give you that. I still have my reservations though...8-).

:#I think it is supposed to be fairly graphical - but I don't know too
:#much about it, and actually am not sure I'd buy it anyway.

I was looking through CGW and found an article on it, so I bought the magazine. Oh, the Return to Zork game is being developed by Activision. It is graphical and with actors. The article goes on with the game having some flaws, but if the Zork legend had to rest on this game alone, there wouldn't be any Zork legend; but as an addition to the series, Return to Zork is more than satisfactory.

:#That's true, but his company is not one that I miss a whole lot - what
:#concerns me more is the number of big developers latching onto the
:#system. Perhaps later I'll care more about the small companies.

Team 17 and Psygnosis will be a lot to miss. Though I did see an article concerning developers for the Jaguar. It had a few names that were a subset of developers already doing stuff for the CD32, and I believe Psygnosis was also included. I don't know where Psygnosis officially stands on the Jaguar, Stefan maybe will be able to give a clue. The article goes on to say there are some small name companies, with a few names mentioned that I've never heard of.

:#But I doubt I'll even be able to afford all of the cart games coming
:#out as it is - I'll probably get Raiden and AVP, but I really can't
:#afford much more for awile. There's enough cart games to keep me
:#happy for awile...

But, if the CD versions were cheaper than the cartridge versions wouldn't you be able to purchase more games...8-).

:#Yep, that's the plan.
:#The jaguar is scheduled to include Photo-CD, and Cinepak out of the
:#box. It will have an MPEG cart for the CD-ROM movies (not that I'd be
:#so foolinsh as to buy an MPEG cart), and they have also said they will
:#have an MPEG-2 cart for decoding movies broadcast over cable lines and
:#such (i'm not so sure about this either, but it might have potential).

I've heard MPEG2 mentioned for the 3DO also, but I'd probably wait to see how MPEG-1 does first before thinking about MPEG-2. C= hasn't mentioned any plans about MPEG2 for the CD32 but, given C= track record of keeping quiet, it wouldn't surprise me if they had plans but just not saying anything otherwise nobody will buy MPEG-1.

:#|> fighting the same battle and winning with laserdisks already around.

:# Easy: $COST$ They will cost less than a laser disk.

I don't know about this. Isn't CDROM movies about 1 hour per disk?
That'll mean two disks per movie for the average movie. I'd think
producing stamping 2 disks will be a little more expensive than stamping 1
disk. Also, the initial prices will be a bit higher than laser disc prices
now. When more units get sold then we'll see a drop in CDROM movie prices.

Laserdiscs are here to stay. No laserdisc owner is going to give up their
collection in favor of CDROM format, well at least me...8-). CDROM movies
will not replace Laserdisc but most likely be an alternative for others
like William..8-).

Georges Kesseler (kesseler@arthur.crpht.lu) wrote:

:#> I do wonder though how many titles are out on LD - does anyone have a
:#> rough idea?
:#About 4000 Movies.

Only if you count movies. There are music videos, and a whole slew of
other stuff. The actual title count is much higher, also let's not forget
the Japanese stuff, they are really heavy into this. In Hawaii, there are
a lot of Japanese made LDs available, though most are in Japanese..8-).
I have Lensman which is an anime with one track being in Japanese and the
other track being in English. I wouldn't recommend this anime though since
the storyline is awful. There are many other good anime stuff though.

:#And that's the reason why I will buy an LD-player.

Make sure you do your research when you buy an LD player. Some bargain LD
players will not play certain formats. You might also want to make sure
you have a player that can play both sides, really inconvenient if you have
to get up and turn over the LD.

:#I agree.
:#You see lot's of VIDEO titles, because people rent videos. You don't see LD
:#titles because those are not rent but bought (mail-order). I won't buy many
:#movies on video. You watch them 5 times and have already dropouts.

Yes, this is definitely true. Why pay about 3 dollars to rent an LD when
you can purchase it for about $20-$30 on the average, and watch it whenever
you want.

:#You heard it here first - I predict an amazing Lynx comeback tied to
:#the Jaguar's success. I think a major reason the Lynx had trouble was
:#no console tie in to instill loyalty.

No, lack of software killed it. Atari promised a lot of software for the
Lynx and at first it had software but, afterwards the rate of new stuff
started falling off. A damn good portable, much better than the Gameboy
but, Atari didn't seem to think it was worthwhile to keep it alive.

:#) How am I supposed to believe all of a sudden that the Jaguar would
:#)be any different?

:#Well, because they really have been doing different things. I only
:#ordered my Jaguar after I saw that they were actually advertising (A
:#real physical Gamepro ad that I could touch), and had good press
:#coverage - that plus the developers they've signed up convinced me.
:#I've never seen anything like this for the computer line.

Same thing happened with the Lynx, lots of advertisements in the beginning.
I used to see ads for the Lynx cropping up everywhere. It depends on
whether or not Atari will continue to support it. Without the support,
developers will be scared off.

: The bitmaps would indeed be smaller, but what I'm wondering about is whether
: there is added effort in creating bitmaps that conform to this or not... and
: how much coding is required to do what has been described.

: (it sounds quite feasible, just tough to develop for)

The solution is simple: Draw all your graphics in 24 bits, then use a special
conversion program that fixes all of those problems like optimizing palette,
etc. Then you're off! And most developers have pretty speedy machines, which
will make the conversion fast enough. And you've always got multitasking as
a last resort - edit your sources while having the graphics being converted.

Have fun, Kristofer.

Small problem here... The non-preemptively-multitasking nature of the PC is perhaps the worst about it, according to many Amiga advocates. I wouldn't go as far as to say that this makes Atari computers just as bad - the processor is good stuff, anyway - but most Amiga fans seem to dislike the Atari ST and Falcon for the same reason. And also remember that we have to fight the Mac users, too.

Have fun, Kristofer.

The Falcon's DSP at 16Mips (24bit) can decompress an 160x120 MPEG with 12FPS.
So it is quite possible to achieve FMV on the Jaguar.

I don't care if it applies to the cd-32 or not. You read the
newsfeed. Atari fucked up the first batch of jaguars. Don't
confuse initial hype for a product for its chances of long-term
success.

I don't really understand this fanatical devotion to Atari anyway.
It reminds me of a few years ago when Apple released the IIgs.
All the fanatical Apple II heads (not me, cuz i had no $$) bought it,
despite its incredibly slow processor speed. It ended up selling
a lot, but because the hardware straight up blew no one developed
any software for it. It sucked that this happened since I was a
kid who'd used Apple computers for years and had some sort of
attachment to them. How many times has Atari disappointed when
they were expected to deliver? The Jaguar is a great machine,
but I'll wait and see if it's a success..

I don't understand this fanatical devotion either, but it certainly isn't unique to Atari. In any situation you're going to have a wide range of personality types and it just so happens that the fanatical types are the ones that are most visible in a forum such as this.

I also think this dissapointment thing has a lot to do with peoples expectations (often driven by fanatical tpyes). Since I have been reading the net news (just a few months) I have seen the smallest little pieces of news get blown way out of porportion by flamers to the point where others start accepting it as fact. Is Atari (or other favorite company) the ones spreading all the hype or is it the fanaticals who read way more into things than was ever intended?

So I have been an Atari user for 13 years now and when they announced the Falcon I was excited about it and of course my expectations were seriously raised by all the ranting and raving on the net. So I finally got a chance to see one in action and I liked what I saw and so I bought one. Now I am having fun with it and running almost every application that I use on a computer on the Falcon (ie it does almost everything I was doing on the Mega previously). However, I do not see that it has become as popular as some hoped and I do not see massive amounts of software being developed for it and in fact a couple of my favorite applications have not been made to run on it yet. So whos fault is that? Sure Atari could have made it

sooner, or more powerful, or cheaper, or whatever. Sure more people could have bought it and more developers could have supported it. But they didn't and while that has affected acceptance of the machine, the product Atari has given us is still a good one and I am very pleased with it.

So what's the point? I completely forgot... oh well, this is the advocacy group isn't it. I guess it takes all kinds...

>>What graphicsmode is the CD32 using for its FMV?
>
> You're the one who's got problems with the reading. The CD32 does not
>render the graphics internally - the FMV module renders the MPEG stream
>to it's own framebuffer, and the CD32 video can then be superimposed on
>this (genlocked, basically). Same deal with sound.

The FMV attachment for the CD^32 uses C-Cube's MPEG1 decompression chipset--
Same chipset found in many high end nonlinear editing systems for the Mac and
SGI. Not a "wimpy" chipset by any stretch of the imagination. A chipset like
that could easilly handle MPEG streams at a level equative to SVHS, and
-certainly- of higher quality than standard VHS.

And as Stefan points out, the FMV add-on runs totally independant of the CD^32
unit--the FMV unit access the CD-Rom directly..You can be playing Stardust on
your CD^32 deck, and watching Paramount's Star Trek VI in a window with
relative ease.. Or Watch Star Trek IV and play -Stardust- in a window, for that
matter. :)

>So it is quite possible to achieve FMV on the Jaguar.

Granted you had a CD-Rom *available* for your Falcon, much less a programmer to MAKE an MPEG player to do it with! :) And please remind yourself that your Falcon had an 030, while the Jaguar has a puny 68000 running at barely over .9 MIPS. @ 13 Mhz. The CD^32's CPU runs at 4.5 times that speed. Ive seen a Jaguar in action, And I personally would be suprised if it could animate a full-screen animation at greater than 5-6 frames per second. The Jaguar's hardware, to put it bluntly, looks weak in comparrison to CD^32 combined graphics and CPU horsepower.

Go play Stardust on one of the "old" ECS Amigas, and youll see why--An ECS Amiga with 1/4th the CPU horsepower of a CD^32 and half the graphics horsepower of the CD^32's AGA chipset. The Jaguar cant even touch it.

)|> real physical Gamepro ad that I could touch), and had good press
)|> coverage - that plus the developers they've signed up convinced me.
)|> I've never seen anything like this for the computer line.
)
) True, but ATARI has to come out with software and support.
)
) And they pack in in a $250 machine a switch box which is not
)automatic, don't put a dust cover in their cartridge port, have
)a couple of RF interference and no cables for stereo sound...
)
) You know what I mean? But I agree, they are doing a lot of
)different things, which is why I GIVE THEM A CHANCE. It doesn't
)guarantee success, and it doesn't mean I don't have the right
)to be skeptic.
)

Actually, on rec.games.video.misc, I read about someone who got one of
the bad switchboxes - he called atari on the 800 number, and they
shipped a new automatic switch box in 5 days!! Now that is real
customer service.

The old Atari would have just said "What switch-box problem?" and
shipped out all 40,000 units.

As for he no stereo cale, I think that MOST people won't want stereo
cables anyway - the majority of SNES's I've seen just go to the TV.
So it dsoes make some sense to have an adapter that you can buy to get
features you need.

)|>
)|> As for the ST CD, well you can just get any 'ol SCSI CD-ROM and hook
)|> it up to an ST. True that there are not a lot of ST specific CD-ROms,
)|> but I can use photo-CD, or DTP CD stuff.
)
) No NO NO! I am talking about back in 1986 when ATARI was proposing
)doing something like CD-I is attempting today. At that time, THAT
)would have sold.
)

Hmm, I thought it was just a CD-ROm for the ST's, I hadn't heard about
anything like a CD-I machine.

)|> ) I has potential, and ATARI *seems* to be doing the right moves...
)|> )that's one thing...
)|> )
)|> ) But again, one thing is racing half the race and make it to the
)|> )goal, and another is racing half the race and come out in the last place.
)|> )
)|>
)|> But Atari's off to a good start in this race, instead of sitting at
)|> the gate trying to tie their shoelaces like the usually do.
)
) True, doesn't mean they won the race though.
)

But it means they are still in it - there are people who won't even
give them that much credit.

)Kendall Helmstetter Gelner (kendall@great-gray.owlnet.rice.edu) wrote:
):#In article <CHKA59.LDA@news.Hawaii.Edu> jimmy@Hawaii.Edu (Jimmy Chan) writes:
):#)I hope you really don't believe that ALL Jaguar games will be all new games
):#)and not just ports. Even SEGA and Nintendo had their share of ports.
):#)Until there comes out a quantity of games for the Jaguar you don't know for
):#)certain what's going to be good and what's not.
)
):#True, but for the most part the Jaguar won't be getting as many ports
):#of games with poor gameplay. And personally, I doubt I'd by an SNES
):#port unless it offered better graphics or sound, in which case it has
):#been tailored for the jaguar... I guess that's really what I meant.
):#The CD-32 is getting a lot of stuff that is just A1200 or A500 games
):#dropped onto the CD.
)
)Actually, if you look at it this way, any game that gets ported will have
)to be tailored to run under its new environment. Same goes for CD32 or
)the Falcon or the 3DO. Now, the amount of tailoring that is done is
)debatable. Ports can be done very well or done very badly. Same goes for
)titles that are created specifically for that machine where they can be
)done very well or very badly. It's true that the CD32 is getting a lot of
)stuff from the A1200, but the CD32 is an A1200 at heart. This is what
)Rickard T. can't seem to understand. If it is already tailored for an
)A1200 then the least the developers will do is one of the following to
)bundle it with other A1200 games, include CD soundtrack, add levels, etc.
)or some of these or all of these.

The thing is, since the A1200 games will work right off of the CD, I
don't think you'll be seeing as many improvments overall as you would
in porting to a new platform - it's true that porting also leads to
the possibily of a worse game, but if the game manufacturers care then
they generally work on improving graphics or sound or something.

)
)When the Jaguar CD becomes available, the developers will most likely take
)games from the catridge but include the same thing in the previous
)paragraph, you'll have extras added.
)
)There are a lot of games I would like to see ported that I have yet to
)play. Even if they are old games, I wouldn't have played it as yet so,
)it'll still be new to me...8-). I'd rather have a large base of software
)to choose from, good and bad, new and old, rather than a small base of
)software with only new stuff and possibly all good. I'd like to choose
)what I can play rather since not everything that comes out suits my taste.
)

I'd rather have a small base of software on a really good machine than
a large base of software on an OK machine. I can't afford to buy more
than about two titles a month anyway, so a vast selection is not as
good if there are not many quality things. I know that there are some
for the CD-32, but I see a future of a lot neater stuff for the
Jaguar.

):#That's true, but the Jaguar has enough big developers now that the
):#hardware potential actually means something - with enogh good
):#companies working on projects, some really good games that use the
):#hardware well are bound to arrive.
)
)I agree here but the problem I have with the Jaguar now, is that it doesn't
)come with the CD. With the CD, developers wouldn't have to worry about
)trying to fit it into a smaller cart, and they'd have a whole CD to play
)with to push the machine to its fullest.
)

Well, some developers are already developing CD stuff, I think the
ones that want too can ask atari for a CD-develpment system. I just
don't see this short delay as much of a problem.

):#The problem I see with the CD-32 is that is has a much lower "upper
):#ceiling" on performance.
)
)8-). I see the CD32 with a much wider choice of options, though. I not
)sure yet about the 3DO though, it has a lot of potential but, potential
)doesn't always cut it, I'm waiting to see what their # of units sold is and
)the number of software that's actually seeing daylight. The same can be
)said of my feelings for the Jaguar too.
)

It what way a wider choice of options? It seems to have about the
same options as the other platforms.

):#Perhaps, but I think enough quality games can be made on a cart to
):#make it worthwhile until the CD comes out. Also, if the CD breaks
):#down I can still play the cart games, and I also imagine that some
):#company someday will figure out how to make a cart+CD game that could
):#use the strengths of each medium to do a lot.
)
)I give you that. I still have my reservations though...8-).
)
):#I think it is supposed to be fairly graphical - but I don't know too
):#much about it, and actually am not sure I'd buy it anyway.
)
)I was looking through CGW and found an article on it, so I bought the
)magazine. Oh, the Return to Zork game is being developed by Activision.
)It is graphical and with actors. The article goes on with the game having
)some flaws, but if the Zork legend had to rest on this game alone, there
)wouldn't be any Zork legend; but as an addition to the series, Return to
)Zork is more than satisfactory.
)

Hmm, well I guess it might be interesting. I'd have to see it first though...

):#That's true, but his company is not one that I miss a whole lot - what
):#concerns me more is the number of big developers latching onto the
):#system. Perhaps later I'll care more about the small companies.
)
)Team 17 and Psygnosis will be a lot to miss. Though I did see an article
)concerning developers for the Jaguar. It had a few names that were a
)subset of developers already doing stuff for the CD32, and I believe
)Psygnosis was also included. I don't know where Psygnosis officially
)stands on the Jaguar, Stefan maybe will be able to give a clue. The
)article goes on to say there are some small name companies, with a few
)names mentioned that I've never heard of.
)

Well, erm, actually I haven't really liked the gameplay on the
Psygnosis stuff I've seen - though the games looked nice.

):#But I doubt I'll even be able to afford all of the cart games coming
):#out as it is - I'll probably get Raiden and AVP, but I really can't
):#afford much more for awile. There's enough cart games to keep me
):#happy for awile...
)
)But, if the CD versions were cheaper than the cartridge versions wouldn't
)you be able to purchase more games...8-).
)

Ah, but I haven't seen that happen yet - 3DO games cost as much as
Jaguar carts (even lemmings!)

):#Yep, that's the plan.
):#The jaguar is scheduled to include Photo-CD, and Cinepak out of the
):#box. It will have an MPEG cart for the CD-ROM movies (not that I'd be
):#so foolinsh as to buy an MPEG cart), and they have also said they will
):#have an MPEG-2 cart for decoding movies broadcast over cable lines and
):#such (i'm not so sure about this either, but it might have potential).
)
)I've heard MPEG2 mentioned for the 3DO also, but I'd probably wait to see
)how MPEG-1 does first before thinking about MPEG-2. C= hasn't mentioned
)any plans about MPEG2 for the CD32 but, given C= track record of keeping
)quiet, it wouldn't surprise me if they had plans but just not saying
)anything otherwise nobody will buy MPEG-1.
)

Actually, MPEG-2 I think has a chance of surviving while I hope MPWG1
flames. The reason is that while I am not willing to pay for
something that has the same quality as a good VCR but cannot record, I
am willing to pay for something which lets me receive digital
transmissins of video that look really good (MPEG-2). I guess the
only problem is that if MPEG-1 fails, MPEG-2 could die with it in the
minds of the companies.

Then you obviously have problems reading my posts ..

On the CD32, people just copy old games onto a CD.

On the Jaguar (no matter if the game's a port or not) they will have to
re-write it, making the possibility of added features likely.

Understand now?

JC> Only when the CD comes out which will not be for many more months. Don't

"many more months" has still not been officially confirmed, although I find it
likely that Atari wants to wait until they can back it with software.

My Falcon has a DSP .. Brainstorm has written an MPEG-1 decoder for it .. 17fps
at 320*200 TC (May be 160*200, but I think it's 320 .. )

The Jaguar's DSP (and GPU) should be even faster.

SB> You're the one who's got problems with the reading. The CD32 does not

Okey, so the FMV module is all that's needed really, none of the CD32's
hardware is used?

Charles, remember that 4096 color variations from a main register is quite
a bit! This is C='s quoted 256 * 1024 colors, atlhough carefully choosing
the base registers you can get more than that.

|>
|>

If the DSP has DMA access on its own to the memory, congratulations
on the Falcon. However, this isn't what I heard around here a couple
of months ago: supposedly the DSP had 96K RAM to work with, not
the RAM that the 68030 sees...

|> (for verification, check out how fast the JPEG algorithm runs on the 56001
|> on the Falcon... I remember a while ago someone posted a benchmark showing
|> it outperformed some '040 machines on that task...)

I can imagine it... the same way an FPU might outperform for other things...

But remember, I am talking about moving memory once you decompress it.
True, the Falcon will have a big advantage if the compression algorithm is
good like say - mpeg (or 'heavy' computational).

Charles, I fogot to add that remember that you can alter the base 64 color registers per horizontal line using the Amiga's copper.

This takes 0 cpu time...

# 3483. need help with hard drive, want to buy

Newsgroup: comp.sys.atari.advocacy
Date: 1993-12-09 04:19:32 UTC
From: rge@helix.nih.gov
Message-ID: <1993Dec9.041932.26366@alw.nih.gov>
Source record: 19755
Cross-posted to: comp.sys.atari.advocacy,comp.sys.atari.st

Hi guys,

We recently got a vintage 1987 Supra shoebox enclosure with an Atari host adaptor. It had a Miniscribe 20Mb drive that still ran but was chock full of hard blocks (too many to successfully reformat). Unfortunately I threw it away without writing down the model #. We've tried several other drives (SCSI and Miniscribe) with the host adaptor, none of which it recognizes. I've been told that this adaptor won't recognize anything bigger than 30 Mb. Can anyone tell me which drives it will work with? Does anyone have a (cheap < $50) one to sell?

The only marker on the host adaptor is:

" Supra c(1987) 30-0014-5 "

I may be able to get a replacement Miniscribe from our Surplus dept here. What model # should I look for? The one I have already is a Miniscribe model 84255, taken off an old Unix machine. Should this drive work?

Every drive I've tried triggers a "dma device not responding" message.

Yes, but isn't 65536 colors freely chosen better? :) (no need to go into
all the details again of why you feel HAM8 is better. Just found that after
all the 65000 colors isn't enough! we now get 4096 color is plenty! from the
same people...)

[sing to the tune of Mel Brooks' "The insuisition' from HOW Pt 1]

Misinformation, what a show!
Misinformation, watch us blow!

(I forget the rest...)]

Look, you cannot compare the 030 in the Falc to the 000 in the Jaguar. The
Jag is designed around a completely different idea than a computer.
And stop lying about how the CD32 looks better. I think you are the only
person in the world who believes so, and shouting won't make it true.

~Chris

Amen to that! I'm amazed at all the publicity for CDi, FMV, MPEG2 et al as if they are pushing forward the bounderies of high quality video. They're not! At best, they are getting *near* to laserdisk which is over 12 years old and still reigns supreme as the ultimate method of watching movies at home.

)

I'll accet that my Falcon is not going to be able to do any FMV off of
CD - that's reasonable.

But then you go into the standard mindless rant about the CD-32's
processor being 4.5x faster than the Jaguars Joystick controller - so
what? The Jaguar does not just BLOW AWAY, but in fact ANNIHLATES the
CD-32, leaving not a spec of cheap plastic to be found. The jaguar
has TOM and JERRY which are IMMENSELY faster than the Fat Albert or
Jughead & Veronica or whatever chips you have in your pitiful CD-32.
The Jaguar can simultaneously render an infinate number of angles on
the head of a TRANSPARANT pin, all while playing the HALLELEUA CHOURUS
at 50KHZ, by mixing the 86-BIT DIGITIZED sound samples from each of
the 230 choir members.

In short, you are wrong.

Grumpily Yours (hey - it's finals week),

<much misinformation deleted...>

Err... excure me but since when have MPEG's been synonymous with CD-ROM drives ?
The whole point of an MPEG is to compress an animation to an extent that it can be stored easily on disks / in limited memory. Oh yeah, and the program _does_ exist to do it, it just costs a bit too much for anyone to licence it right now.

Get yer facts straight next time eh ?

Ok here is the latest gaming/Jaguar news. Everyone see
CNN and the new game system comparison? They said 3D0 was in money
trouble and the Jag was the techo Top Gun. Also if you want to get
cheap 3D0s Babbages will be selling lots of refurbished defective
3D0s sometime soon!

No mention of Commodore CD32 although a couple weeks ago the news said
that C= said they may be going out of business?! C= lost over $300
Million and have only around $5-8 million cash. My brothers friend
is a lawyer and also said Commodore lost a multimilion dollar patent
lawsuit earlier this year and owe Cadtrak and banks over $30 million.

hope this comes out ok

<[Host] ST.LOU> Before getting started, some business about how an
RTC works. While the RTC room is in Listen-Only mode, you can only
address our guest when I let you talk. To get my attention, just
/RAIse your hand. Just enter this from your keyboard: /rai

<[Host] ST.LOU> I'll acknowledge your raised hand as soon as I can,
but please be patient. I will let you know when your turn is coming
up.

<[Host] ST.LOU> Some other RTC commands are:

<[Host] ST.LOU> Welcome to the December edition of Dateline Atari
with Bob Brodie. I am going to keep my introductory comments REAL
short because the last time Bob joined us - so did over 100 people!
With that many people, some were disappointed that we ran out of time
and could not answer their questions. No doubt the focus of tonight's
Real Time Conference will be the Jaguar's outstanding rollout in New
York and San Francisco. I am sure Bob will talk about Atari's
fantastic success with this incredible product. Before beginning, I
would also encourage you 'gamers' to check out the new Jaguar CATegory
in the Bulletin Board. May I suggest you begin by downloading the

fast-accumulating archive files! Now, heeeeeeeeeeere's BOB!!!!

It's great to be on GEnie for our monthly Dateline:
Atari! Session. I'd like to take this opportunity to extend my
wishes for Happy Holidays to all Atarians. May this holiday season be
full of joy for you and those that you hold dear!!

We've got a lot to talk about as we head for the
holidays, and some of the much sought after Jaguar T-Shirts to give
away tonight, so let's get started!!

Tonight, I'm once again coming to you from the East
Coast. This session of Dateline: Atari finds me as guest of Ron
Kovacs of Z*Net News Service. Atari has sent me to the New Jersey/New
York area to visit the retailers that are presently carrying the
Jaguar. I'll be here for five days, returning to Sunnyvale late
Friday night. I'm grateful that Ron has opened his home to me for
dinner this evening, and to do tonight's RTC. This also marks the
first time we've had a Dateline: Atari

Following the roll out event in New York last month, we
began shipping the Atari Jaguar, our new 64 bit multimedia
entertainment system. Consumer acceptance has been outstanding, and
we are working to accelerate shipments to meet demand as quickly as
possible. Virtually every retailer that is carrying the Jaguar has
sold out their present allocation!! We will be shipping additional
quantities of Jaguars today, and next week. Our roll out hasn't gone
entirely smoothly, though. We have had some consumers report that
they had problems with poor image quality on the screen. Upon
investigation, we discovered that some of the RF switchboxes, which
were supplied by an outside vendor, did not meet our specifications.
We stopped shipping Jaguars briefly in order to remove the defective
switchboxes, while we acquired an acceptable replacement unit. The
new RF switch box is upgraded from the initial RF box, in that it is
an auto switching unit. In the event that there are people that still
have the defective switch box, they can call our 800 service number,
1-800-GO-ATARI. We will be happy to send them a new switch box at no
charge. For those customers that have already obtained another
switchbox, or do not wish to wait for Atari to replace their defective
switch box, Atari will send them free of charge their choice of an
S-Video or Composite Video cable. These customers should call
1-800-GO-ATARI, and return their defective switchbox. Please remember
that this 800 number is strictly a service number.

Atari regrets any inconvenience that this might have
caused our customers. On a personal note, I read a number of posts
on-line speculating that Atari might have utilized old RF boxes from
the Atari 2600, XE Game System, or other products. That's simply not
true. Ironically enough, if we had been as cheap as some of our
critics would have you believe, there probably wouldn't be any problem
with the RF boxes in the Jaguars! While this has been an
unfortunate happenstance, it does underscore the value of doing a test

market to discover any problems before going national with a new product.

The weekend following the New York launch event, Atari conducted a promotional event at the Newport Mall in New Jersey. We're pleased to report that the event was a tremendous success! Thousands of youngsters participated, and enjoyed a hands on experience with the Jaguar!! Atari is pleased to announce tonight that there will be another mall presentation of the Jaguar, this time at the Tanforan Mall in San Bruno , CA. This mall is located off of Interstate-380 and El Camino Real, not too far from San Francisco International Airport. We'll be at the mall on this coming weekend, December 11-12. Those of you in the Bay Area that haven't had a first hand look at the Jaguar should stop by this event. We'll be giving away Jaguar T-shirts, and Jaguar caps at this event as well.

I've been swamped with requests for Jaguar units for reviewers, the amount of attention that Atari is garnering for the Jaguar is simply _HUGE_. Atari has had the Jaguar showcased on the CBS Morning News, The Today Show, we're going to be on "Good Morning America!" during their hot Christmas gift giving segment the holidays. The Jaguar will also be featured in "Hi-Tech Toys for the Holidays" segment of the "Next Step" program produced by The Discovery Channel and KRON-TV, Channel 4 in San Francisco. Those of you in the Bay Area will be able to see this segment of "Next Step" on Friday, December 17th at 8:00 PM on Channel 4. Nationally, the show will be available on The Discovery Channel, which airs on Tuesdays at 9:30 PM. Show host Richard Hart is also the high technology reporter for KRON-TVs NewsCenter 4. KRON-TV is the San Francisco NBC affiliate.

The latest edition of "Die Hard Game Fan" is hitting the streets now, with Cybermorph on the cover of their current issue. Die Hard Game Fan reviewers made Cybermorph their Game of the Month, rating it 99, 98, 98, and 96!!! Be sure to check out this issue of Die Hard Game Fan, it has close to 8 full color pages of Jaguar coverage. They also review the next game due out for the Jaguar; Trevor McFur in the Crescent Galaxy, and a terrific poster of Cybermorph that their staff artist created!! The current issue of Electronic Gaming Monthly also has a "Future Wave" coverage of the Jaguar version of Raiden!! Trevor McFur in The Crescent Galaxy is due at Atari next week, with Raiden due in Christmas week. Evolution: Dino Dudes was the last of our titles to be released by our game testers, and should be in the stores shortly after Christmas. Be on the lookout for other Jaguar coverage in Game Pro, Video Games, ST Format, and ST Informer Magazines!!

On the review front, I'm doing the best I can to keep up with the demand for review units, but there are bound to be a few people that will be upset if they don't receive a Jaguar for review. If you have a particular publication that you feel would be useful for Atari to have the Jaguar reviewed in, please feel free to send me a

note in GEnie mail with your suggestion. I've been amazed at some of the publications that are excited about the Jaguar, including publications that normally just review video products, rather than video games. Atari has also been contacted by a number of more "mainstream" publications that are very interested in the Jaguar. Sometimes it feels like anyone that has ever written an article is queueing up to request a Jaguar review unit. We're being a little bit careful about where the units go right now. As our supply of Jaguar units increases, we'll be getting out even more units for review. For the time being, I'm concentrating on the magazines, with the newspapers and free lance writers taking a back seat.

On the Lynx front, this week will mark the beginning of the Lynx TV ads that we're going to begin running. These ads will be in the same markets (NY and San Francisco) where we are presently doing our Jaguar TV ads. The print ads for the Lynx have been running concurrently with the Jaguar ads. The Lynx print ads will be changing to reflect a new promotion that we're running for the Lynx - Buy a Lynx between now and Super Bowl Sunday (January 24th, 1994), and we'll send you a FREE Lynx NFL Football Game Cartridge! There are coupon pads being mailed to all of our retail partners now for this promotion. Your cost for the game is just $3.50 for shipping and handling. Be sure to check the next issue of Atari Explorer Online Magazine for all the details on this special purchase promotion. By the way, Atari Explorer Online Magazine is also preparing some very nice GIF pics of the pin outs for the S-Video and Composite cables for those of you that just can't wait for them to get to the stores! AEO will also have some GIFs of the Jaguar roll out event in New York very soon as well. They used a Migraph Color Scanner with a Falcon030 to scan some 35mm photos from the event. I'm sure you'll enjoy seeing them!

On the computer front, we continue to have an excellent supply of Falcon030s in stock. The new Migraph Color Scanner for the Falcon is really terrific, and Cubase Audio for Falcon is getting rave reviews in the Music field!! According to one of our rep firms, Cubase Audio has capabilities that would cost a Mac or PC owner over $7,000 more to obtain!

With that... I'm ready to conclude my remarks and take any questions, Lou. Let's get started!!

<[Host] ST.LOU> Before taking questions, a reminder that the Jaguar T-shirts will be given away to the 4 persons who answer the skill testing question. HINT: The answer is in that massive text file that Bob just uploaded :-) :-)
OK, here we go with Hydraxxus.

<[Hydraxxus] J.GERMAN3> Bob, as you may have seen I posted a question about other nets getting news about Atari before GEnie And complained that I thought this was THE place for Atari news....what's the scoop?
GA

<[Host] ST.LOU> By the way, folks... just one question tonight.

Hi Jim. Well I think what you're really referring to is
Sam's postings. He's been playing around with Aladdin, but not with a
lot of success. On the other hand, he was really impressed with how
easy CIM was to set up. I'm trying out some of the new things like
Oracle for GEnie to see if I can make it easier for him to get on
GEnie. He's using a Falcon, and an IBM laptop. He doesn't care for
Aladdin on either one. I'm in constant contact with AEO, and am
online as much as possible. But as I indicated in my opening
remarks, I'm out of the office now visiting retailers. That doesn't
leave very much time for being online. I'm trying to get here more
often, but it's tought. oops, that's tough. ga

<[Host] ST.LOU> Thanks, Bob. Give me a sec to record all the /RAI :-)
Swamped at the moment :-) Next we have Shadow.

<[Shadow] D.VANTREASE> What's the tentative release date of the CD
unit, and price? And will there be software bundled with it? (CD unit
for Jaguar, that is!) GA

Shadow, the CD is set for mid 94. At this point, we
envision a price of approx $200. No plans re the CDs at this point.
ga

<[Host] ST.LOU> On to Travis at Atari Explorer Online.

<[Noles #1!] AEO.MAG> Hi Bob, Ron. Bob, AEO thanks you for you
dedication to online users. You do a terrific job that many just can
realize. First, congratulations to Atari. The way it looks, the Jaguar
is already a winner with consumers. Bob, I suppose you have had time
to read the response to your letter to Electronic Gaming Monthly in
which they make some pretty interesting claims. Would you care to
respond to them tonight? ga

I thought some one might want to ask about that
tonight... When I wrote the letter to Electronic Gaming Monthly, I
was truly surprised that they told their readers that we were
responsible for the lack of Lynx coverage in their magazine. When I
saw the response to my letter that they printed, I was really upset!

First of all, you have to understand that prior to my
taking over the relationships with the game mags, they were handled by
Juli Wade. She had been asking EGM to return the Black Box that they
had for a couple of years. Every time she asked them to return it,
they denied having a Black Box. (We knew that they had one...our
staff in our Chicago office gave them one.) It wasn't until she
resorted to asking them to return it so it could be modified to work
with the Jaguar that they finally returned the box that they had
denied having for YEARS! And they have the gall to say honesty is the
best policy?!?!?!?

While they bemoan our supposed lack of support, we
agreed to meet with EGM Editor Ed Semrad the day after our initial

Jaguar press conference in Sunnyvale because he couldn't make it to the "real" press conference. Ed was given hours of exclusive, hand on time to question myself and Bill Rehbock, all without the hassle of the crowd that the other media had to contend with at the press conference. Ed makes regular trips monthly to the Silicon Valley to visit Electronic Arts, Sega, Capcom, 3DO, and other companies. I invited him to visit us on his next trip, but he chose not to. Instead, he returned to our office two months later, complaining about the fact that other mags had screen shots that he didn't. So even though other publications had obtained the shots that AEO had uploaded for us, I modemed all of the screen shots (close to 14 megs) to EGMs offices so Ed wouldn't have to mess around with a Syquest.

When EGM called to ask for a Jaguar unit so they could have coverage in their issue for CES, I personally got the unit shippped out from a Fed Ex office that accepts shipments past the normal cut off times. I sent them out a unit that had literally just come back in to the office from the Newport Mall event in New Jersey.

I'm very sorry that EGM seems to think they aren't getting proper support. The fact is that the support we've been giving EGM _IS_ what they need, but it is not what _they want_! Other magazines print reviews of Lynx games with the very same support from Atari. For EGM to say that they can't write about the Lynx simply isn't true. If they were really honest, they would have said that they WON'T write about the Lynx.

But then again, if they were really honest, they would have returned our Black Box when we asked for it. Instead, they denied having one for YEARS!

Mind you, this is the same magazine that constantly insults Atari in print. In one publication, they ran a column telling people what to do to get on the cover of EGM. One of the suggestions was new hardware always gets on the cover...unless it's from Atari. Another column ran the top ten reasons that the Jaguar will fail. There were two versions of that column. One of them ran in a sister publication of theirs called "HERO Illustrated". According to them, the number one reason that the Jaguar will fail was Sam Tramiel. I was shocked to see that they were so very personal, so nasty, in their attack on Atari.

The last time Ed was in our building, we discussed all of these things with him. Ed assured us that he just wanted to run a quality magazine from an editorial standpoint. Sam Tramiel personally spoke to Ed, and simply told Ed that he didn't know what the problem was between EGM and Atari. Sam asked Ed for a better relationship, and for all the nasty commentary to stop. We have even started advertising with EGM, like the other game magazines.

After everything Atari has gone out of our way to do, I'm shocked that Ed would be so arrogant, so very nasty in his reply to my

letter. If they choose to ignore the needs of their readers, that's they're choice. We've seen what happens to other publications that ignore their readers needs, and continually insult and belittle people in their publication, like STR. They burn _all_ of their bridges, alienating consumers and industry people alike, and then wonder why they don't get any information. I hope that EGM won't be foolhardy enough to continue down that path.

At this point, I recommend that you read Game Pro, Die Hard Game Fan, or Video Games to get the best Atari coverage.

<[Host] ST.LOU> Wow... were you expecting that question? :-)

Or of course, AtariUser Magazine. ga

<[Noles #1!] AEO.MAG> I think we all should give Bob a round of applause for the job he does. ga

<[Host] ST.LOU> Thanks Travis. Bob, let's welcome Nate to the RTC>

<[Nate] L.JESSE> Bob, first, what is Atari doing about third party licensees such as electronic arts and Capcom, etc.? Secondly, what options do i have, I'm from Illinois, to get a Jaguar before X-Mas? GA

Hi Nate, we've signed up over 35 licensees at this point. EA is not on the list yet, which is no surprise considering Trip Hawkins close involvement with 3DO.

<[Host] ST.LOU> Folks, there are 14 in queue. I will get to you ASAP. Thanks for being patient. GA, Bob

However, EA is really much more of a publisher, than a developer. We've gotten a number of licensees that have been published by EA, like Park Place. Re Capcom, they have requested a development unit, and we're expecting to have a meeting with their staff in Japan at some point.

<[Host] ST.LOU> REMINDER... the answer to our T-Shirt Draw question is in Bob's opening remarks.

Being from Illinois is tough right now. I was reading in the BB earlier tonight about a number of people being told by Babbages that we had dropped the ball. I'm certain that this is just a misunderstanding by the personnel in the store. We've been very clear with their corporate management that we would prefer they restrict their shipments into just SF and New York. If they go out of those areas, they are diluting the product availability to the target areas. ga

<[Host] ST.LOU> Thanks. Now Sam RAPP!

<[Sam_030] SAM-RAPP> Bob... When will you be shipping Jags to those of us that ordered from Atari Direct? It has been almost a month since you charged my credit card! I figured you were waiting for the

next batch of T-shirts, so you could send one along! Would it help if I had only ordered the console, instead of an extra controller and two other games? Thanks! GA

Hi Sam, the Jaguars will be shipped to you so that they will arrive before Christmas. I wish I could be more specific, but I cannot give you a more accurate statement at this time. Remember that the units are really being shipped by IBM. So for the orders that are sent out from Sunnyvale, we have to get a shipment from IBM before we can ship, too. ga

<[Host] ST.LOU> Ooops, I missed Hal. Here he is now. GA Hal.

<[Hal] H.SCHEIE> I have a Jag on order from J&R, I'll get it in their next shipment .Any chance it will be this week?

I don't have the exact allocations on hand, Hal. I believe so, but can't guarantee that. Please, remember that I'm NOT in the office right now. ga

<[Host] ST.LOU> Sean from Processor Direct

<[Sean@TWP] P-DIRECT> Good evening Bob, easy question for you tonight: Are any developers are making an indepth flight sim for the Jaguar, and if not could you pass the hint on to them? GA

Can you say Microprose? ga

<[Sean@TWP] P-DIRECT> Not chopper.. GA

Fighter sims, jet sims, etc.

<[Host] ST.LOU> Sounds good to me. Next we have Ken.

<[Ken] K.STEVENS1> Hey Bob, still waiting for my direct order Jag (hint, hint). Question, how many titles are being developed/ready for the Jag CD? (By the way,how do you give a round of applause on a computer?) ga

Ken, I know of several titles being developed, but I'd rather not get into specifics right now. They are just getting up to speed on the system. Remember, CD games take around 500+ megabytes of data. That's a lot of stuff to develop. ga

<[Host] ST.LOU> Moving along to Kid Metal.

<[Kid Metal] M.MURPHY31> Howdy from Texas, Bob. Will the INcredible Universe in Dallas get any Jags to sell before the national roll-out? GA

Yes ga

<[Host] ST.LOU> Oh..... Mark Warner is next. GA Mark. Welcome

<[Mark Warner] M.WARNER8> Bob, can you tell me what other games beside Alien v Predator are due out in January? I also want to comment on

how impressed I have been with way Atari has handled the RF problem. (whoops thats "with THE way") ga

Thanks Mark. I've been really tied up getting out and dealing with the review unit issues, so I'm about a week behind in that info. Maybe more. At this point, I know that we're hard at work on Tiny Toons, AvP, and Club Drive. But after AvP, I'm not sure about release dates. ga

<[Host] ST.LOU> Charles Smeton of NewSTar is our next guest, Bob.

Hi Bob. Thanks for sending Crescent Galaxy, an extra game controller, and the Jaguar T-Shirts and Hats to the ToadFest. Toad Computers donated a Jaguar that was raffled off and which raised over $500 for Habitat for Humanity. The Jaguar was the main attraction at the show. With the Jaguar being the main focus at Atari, I have heard numerous rumors that the outside of TT's for Jaguar Development Kits, there is little to no activity on the computer end of things at Atari. As a developer with a vested interest in the computer end, do you have any encouraging words? GA

Charles, we're still very interested in the computer business. We're looking for applications that will give people a reason to select an Atari over the competition. Programs like Cubase Audio do just that. We don't have any intention of giving up on the computer business. But in order to do the Jaguar properly, it's requiring just about all of our resources. At least in the manpower segment. ga

Thanks Bob, I just hope that we can hang in there until the resource allocation shifts a bit ;-) ga

<[Host] ST.LOU> Thanks Charles.

Charles, me too. Me too. Please keep... in mind that we've also publically talked about using the Jag as a CPU at some point.
<[Host] ST.LOU> Next we have Hydraxxus... then Hassen

<[Hydraxxus] J.GERMAN3> Earlier you mentioned MP. Did you mean to say you would pass the word or that they were working on titles? (Clap, clap, clap {for the Jaguar, it's a great machine, I like mine}) (nice tie)

Jim, they are working on titles. Glad you like your Jaguar...I wish I had more time to play!! ga

<[Host] ST.LOU> Now Hassen

<[Hassen] H.HAMMOUD> Hello Bob. I was in Toys R us on Friday here in Indiana. They had no Lynx carts at all, nor did they expect to be getting any. What's up? Also, will there be an Asteriods port to the Jag???(I still love that game.) GA

<[Hydraxxus] J.GERMAN3> Gee, free question?

Hassen, we've had a problem with the Lynx in Toys R Us
for quite awhile. However, that has been resolved, and they will be
getting them, along with some promotional material regarding the Lynx
NFL Football game. ga Re Asteroids, we're talking abouti t. ga

<[Host] ST.LOU> OK On to Matt Rivman.

<[Matt] M.RIVMAN1> Hi Bob, and thanks yet again, for being here! The
question is just a bit off the Jaguar topic... Any ideas about the
late financial statement from Atari? I'm a somewhat new investor and
would like to keep up! GA

<[Host] ST.LOU> You folks are being terrific... and patient. Still 15
in the queue.

Hi Matt. We've been so busy with the press of business
for the Jaguar that we asked the SEC for an extension to file. We
should be releasing the numbers very soon. ga

<[Host] ST.LOU> OK, now we have J.Hardie.

Bob, does Atari have any plans to attend the January CES in
Vegas? Also, how about filling us in on the Crescent Galaxy cheat? ga

Yes, we will be at CES in January in our own booth.
Because the booth allocation occurs so early, we didn't get a prime
space. So our booth will be small, but we'll probably have at least
one suite, too. Re Crescent Galaxy...if I told you now, it'd ruin all
the fun for everyone else! :) Suffice it to say that it requires an
extra controller, and there are some specific codes you input for
things. ga

<[Host] ST.LOU> Time out, Bob. If you folks have already /RAI but
were not acknowledged by me, please /RAI again now. I think I have
everyone in queue.... On we go to Jungle Jim.

<[Dave] D.SMITH200> Bob, are there any plans to interface the Jaguar
with existing Atari computers to handle I/O processing for advanced
graphics applications? If not, it might be something to consider... ga

<[Host] ST.LOU> What just happened? hmmmm.....

Dave, we're certainly interested in using the Jaguar
technology across all of our product lines.

<[Host] ST.LOU> Dave, what is your Job #

And we've had a lot of "feelers" from other people
looking to use it on their systems as well. ga

<[Host] ST.LOU> Oh oh... Jungle Jim was 51. JJ... please /RAI now to
get your question There he is....!

<[Jaguar Jim] J.THORNHILL> Bob, while in N.Y. did you happen to stop by ACCLAIM's offices for a little 3rd party chat? Yes, sorry!

<[Host] ST.LOU> GA Bob

Actually, their R & D office is in Chicago I think. :)
I've got a pretty full schedule, Jim. Mostly with retailers and the press. Bill Rehbock will handle the developers. ga

<[Host] ST.LOU> Here's Travis!

<[Noles #1!] AEO.MAG> Bob, I'm sure that the "make good" policy on the switchboxes and the extra A/V cables will go a long way to showing people that Atari Corp. is deadly serious about satisfying its customers. Are you having to visit all the dealers in the NY area, or just the regional offices? (If you weren't so busy, I'd ask you for a report for the next AEO. ) ga

Well there are over 150 dealers in the NY area. And I'm only here for 5 days, so I won't get to all of them. But I am visiting the stores, not the regional offices. We have a rep that is doing that. Thanks for the kind comment about the switch boxes/cables. We're upset about it, too! Heck, we paid for the bad stuff just like our customers did!!! ga

<[Host] ST.LOU> T. Lipsky. Step up to the mic GA T.Lipsky

Bob, Microsoft has expressed intrest in the home market including Childrens software, has Atari been approached by Microsoft regarding the JAguar. ga

No comment. ga

<[Host] ST.LOU> OK... then we have L.GRACE next

Hi Bob. will the success of the Jag help fund marketing for TOS machines? i.e. Falcons. Thanks GA

Yes, in fact we have talked about at some point using the Jaguar chipset for a TOS machine. ga

<[Host] ST.LOU> On to Harj Nagra from Toronto!

<[Harj] H.NAGRA1> When is that Kasumi Ninja game due out? And how does it compare to Mortal Kombat?

Again, I'm a little bit behind on the software release schedule right now. I suspect that it might be the late 2nd quarter. It's designed to be a competitor to Mortal Kombat and Street Fighter II, with lots of blood and gore. :)

<[Host] ST.LOU> GA, Bob?

Nope..just clearing the capture buffer. ga

<[Host] ST.LOU> Steve Johnson is here....

<[DrHfuhruhurr] STEVE-J> Have any new retailers (and developers) signed on that you'd care to mention? There is talk that Sears, Montgomery Ward, and even the vehemently anti-Atari Software Etc. are getting a bit of an itch to carry the Jaguar. GA

Sears and Montgomery Ward are coming on board during the national rollout. Software Etc. is not on the list at this point. We have a few other developers that we signed on, but I want to hold off on the announcements so we can coordinate everything properly with their PR firm. One of the other retailers that I think is very interesting is Blockbuster Video. ga

<[Host] ST.LOU> Apollo is next.

<[Apollo] N.CHANDLER> Modem? Head to Head? Multi-Player Network(s) (Like here on GEnie)? Any plans for this type of gaming? :)

<[Host] ST.LOU> GA Apollo.

Yes, yes, yes!!! In fact, we think that some of the multiplayer networks espoused like the Sega Channel might be better served by a cartridge that allowed you to dial into GEnie to play online games here! The keypad on the controller is perfect for that kind of stuff!!! ga

<[Host] ST.LOU> We're going to Shadow, then our draw question.

<[Shadow] D.VANTREASE> Bob, when will the S-Video/composite 'adapter' be available, and can I order it directly from Atari? Every time I call, they say they have stopped taking orders! Know a price on the adapter? Also, any _longer_ cables coming? (AvP date? :-)

It really isn't an adapter. It's a cable that plugs on to the A/V connector on the back of the Jaguar. The S-Video and the Composite units are not the same. They are separate cables. You will be able to order it, but we're not taking any more orders on Jaguar product at this point until we have fulfilled the orders that we have in hand. I'd guess (emphasis on guess) that the cables will go for around $15-20. The pricing hasn't been set yet. ga

<[Host] ST.LOU> After the contest we have K.Swift, Rob Anisko, P.Irwin, Nate, Chris C., Steve-J, Hassen, T.Hebel and C.Oates. Did I miss anyone? use the /RAI now! OK

ga

<[Host] ST.LOU> I added jobs 33, 10, 25, and 23 to the queue. That will be it for tonight.

Now for the contest.

The Rules:
Only paying members are eligible! No free accounts :-)
Bob will post the question.
Type your answer and don't hit RETURN until

you see that the room is in TALK-MODE.
The first four correct answers judged by Bob and Ron
will win a FREE Jaguar T-Shirt!
OK Bob.... the question please!

In my opening remarks, I mentioned that Atari is now
doing a special offer to people that purchase a Lynx between now and
January 24, 1994. What is the FREE game that you get when you
purchase the Lynx?

<[Host] ST.LOU> 60 seconds.

30 seconds
15 seconds
10,
** <[Host] ST.LOU> Room is now in the talk mode.

** <[Host] ST.LOU> Room is now listen-only.

<[Host] ST.LOU> Ralph's World??? :-) OK Bob.... check your buffer and
declare the winners. after I let you talk.... :-) GA Bob :-)

The winning answer was NOT Flaming UPS Trucks in
Jacksonville.

<[Host] ST.LOU> Hahahaha

The correct answer is NFL Football.

<[Host] ST.LOU> Jacksonville Jaguars? OK... looks like Sean D.

The winners are: P-Direct, P.Hanze, Sam-Rapp, L.Hinsley

<[Host] ST.LOU> Phil Hanze, Stargazer and Sam! Congratulations.
Please send your mailing addresses to ST.LOU and I will forward
everything to Bob. OK? Bob is NOT in Sunnyvale right now.

Sam really doesn't want the shirt. He just wanted to
win.

<[Host] ST.LOU> Not much! :-)

:)

<[Host] ST.LOU> Oh... and send your sizes!!!! with your addresses.
King, what size for you? :-)

Congratulations, gang! You're gonna love 'em. Very high
quality Hanes T-Shirts. If you're an XXL, don't be shy about it.
I've got 'em.

Mine is an XXL and it fits all 320 pounds of me.

<[Host] ST.LOU>a I am getting some very funny /sends :-)

<[Host] ST.LOU> OK....

Yeah, but you gotta dry clean it, King.

<[Host] ST.LOU> Now to finish off the queue. NO MORE /Raises please.
K.SWift

<[Kim] K.SWIFT> Is Atari planning a computer based on the PowerPC chip
set? I want to buy a computer in summer 1994 and that's when the
PowerPC is coming out. To be honest, I'm very tempted. I'd like to
see an AtariPOWER system for s/w compatibility.

<[Kim] K.SWIFT> ga

We've talked about it a lot, Kim. We're longtime
partners with Motorola, and now with IBM, the Power PC becomes very
tempting. However, the Jag chipset is VERY appealing, too. At this
point, we haven't decided. ga

<[Host] ST.LOU> Rob Anisko is next.

<[Zombie] R.ANISKO> Bob, just curious about the origins of Microsoft
Arcade, or that is, how 5 classic Atari games landed up on the old
Windows platform? just hearing about this made me go "hmmm" :-)

<[Zombie] R.ANISKO>

<[Zombie] R.ANISKO> ga

We did a licensing deal with Microsoft so they could do
the arcade stuff. :) ga

<[Host] ST.LOU> On to P.IRWIN

<[Host] ST.LOU>

Hi Bob got my jag. today and it was defective :(

<[Host] ST.LOU> How so?

Butto my question When can we expect everything to hit the
stores... (controllers, CD drive, Cables and such..) (Left Bob e-mail
on how the sound goes beserk) ga

<[Host] ST.LOU> Thanks.

I'm sorry to hear that you're unit was defective.
Unfortunately, that does happen from time to time to all
manufacturers. How was the unit defective? The second controllers
will be available in just a couple of weeks, the CD ROM is due out the
mid part of 94, and the cables will be in the stores the end of
January. I'll look for the email on the unit. Thanks! GA

<[Host] ST.LOU> On to Nate

<[Nate] L.JESSE> Hey again Bob, first of all, 'kudos' on the GEnie
online idea, I love it. Secondly, is Atari planning any character to
represent them? Such as Nintendo's plumber, or Sega's Sonic? How
about Jinx the Jaguar? ga

At this point, we're just sticking with the black Jaguar,
Nate. Once you see the box, you'll have a good vision for how it will
look. All of our marketing efforts are using the black background
with the cat eyes logo. as well as the red JAGUAR logo with the
slashed R on it.

I think it would be neat to see a Jaguar game a la Sonic or Mario. We
do have a Lynx (Cutter) in Trevor McFur in the Crescent Galaxy. Glad
you like our modem idea...some of the phone companies/cable companies
are not as pleased! :) ga

<[Host] ST.LOU> Chris Cassaday... NOT a winner tonight :-)

<[Parrot Head] C.CASSADAY> Bob, with the test market shipments
reaching full capacity in late December, does that push the national
roll-out back any? It would seem that it would take a few weeks
before a 'true' nation-wide tendoroll-out was in force. BTW, I second
Charles Smeton's remarks about 'sending out Crescent Galaxy and the
shirts and hats to the TOAD fest. I had a really great time, and have
a "way-cool" Jaguar hat to show for it. ga...

Hi Chris, glad to hear you got a hat...they're rarer
than the T-Shirts!! Boy, am I getting /sends about the hats now!

<[Host] ST.LOU> Did you get my /send ? :-)

:) I don't expect it to cause a delay. We're actually
getting more up to speed. ga

<[Host] ST.LOU> Steve Johnson is back with another question.

<[DrHfuhruhurr] STEVE-J> NINJA GAIDEN III is the next game to be
released for the Lynx, but do you have a date for it (and others
forthcoming -- hopefully SUPER ASTEROIDS/MISSILE COMMAND and ULTRA
STAR RAIDERS (???), among several others)? By the way, I'd like to
pass on the suggestion to air a few 'well- placed' teaser ads
nationwide this Xmas to maybe take some of the OTHER system sales
away!

Ninja Gaiden III _should_ be here already, I'll check on
it when I get back to the office. I haven't heard of Ultra Star
Raiders and the other titles you mentioned as ones that are going to
be ready any time soon, Steve. Thanks for your suggestion about the
ads, but that would just compound the frustration of people that want
Jags that can't get them at this point, Steve. ga

<[Host] ST.LOU> Hassen returns....

<[Hassen] H.HAMMOUD> Bob, just exactly _when_ is the National Rollout?
Also, anyway one could purchase a Jaguar T-shirt or cap? I bought an
old Atari jacket from Telegames and my nephew loves it!

It will begin toward the end of January, and we'll have
T-shirt, caps, and OTHER GOODIES available for sale then. :) ga

<[Host] ST.LOU> T.HEBEL

<[Spud Boy] T.HEBEL> How many Jags have been made so far... In round
numbers. Also I have heard rumors that you could use the Lynx with a
Jaguar somehow, is this true?

<[Host] ST.LOU> C.OATES ans Sir Fransis follow

Spud Boy, again...I'm not in the office. I do know that
IBM released a bunch of machines today for delivery, but the numbers
aren't on hand. Yes, you will be able to use the Lynx with the
Jaguar. The ports for the Comlynx port are on the expansion bus of
the Jaguar. You will have a special cable to connect from the Jaguar
to the Lynx. We forsee you using the Lynx as a controller for Jaguar
games. ga

<[Host] ST.LOU> Bob, I am told that there were no Comlynx ports on
the Jags at Toad. Can you confirm that? The expansion bus is inside?

The Comlynx signals are on the expansion bus, Lou. Every
Jaguar has one. There isn't a Comlynx port per se on the Jaguar, but
just as you have a S-Video or a Composite cable, you will have a cable
from the expansion bus. It's on the rear of the unit, clearly
accessible from the outside, not internally.

<[Host] ST.LOU> Oh, now I get it! Back to hosting.... :-) Chris Oates

<[Chris] C.OATES2> 1) You mentioned Blockbuster as a retailer. Does
this mean Jaguar games for rent? 2) Any chance of eventually using
Jag + CD as a CD rom for my Falcon? I don't want to have to purchase
two CD Rom drives. GA

Hi Chris, yes...It does mean that you will be able to
rent Jags. They'll also be selling them, too. Re the Jag CD, I don't
think so. The Jag CD is intended to be plugged into the cartridge
port of the Jaguar, and then pass thru for another cartridge to go
into. ga

<[Host] ST.LOU> On to Sir Fransis

<[Sir Fransis] K.DRAKE> My ship pulled into port late! :) Do you know if Atari plans to offer a special deal next year and pack the Jaguar with a CD ROM unit at a lower-than- separate price? GA

Oooooh, have you been talking to one of my co-workers???? :) Well, we have a couple of ideas for the CD. :) I want to point out that these are just ideas, we haven't decided on anything in particular yet. Nah, better not.

<[Host] ST.LOU> Go for it!

Ok, what the heck...

<[Host] ST.LOU> :-)

As you know, the Jaguar CD is also capable of playing Music videos. We're working with some of the musicians we know well to do music on the game, and include a music video with the cd. But that's not cast in stone. ga

<[Host] ST.LOU> Mike wants to know if these are RAP artists. He LOVES RAP music!

All of em.

<[Host] ST.LOU> Next we have J.HARDIE

Bob, I've heard rumours of special controllers being packaged with some games, most notably TEMPEST 2000, what can you tell us about this? ga

Wow, a lotta ANTI-Rappers here tonight!

<[Host] ST.LOU> Four more question, Bob! Mike, calm down :-) Hmmm, /RAP Mike.

Hi J.Hardie, Tempest is still a way out, but we're certainly looking at special controllers. We've also have a few people that are talking about separate controllers to do other things like fighting games. ga

<[Host] ST.LOU> Back to Jungle Jim.

<[Jaguar Jim] J.THORNHILL> 1) Dpo you know why Babbages is telling some people that the CD unit will be $400.00 and 2) Does the Jaguar fit into SGI and Warner's plans for a cable TV bix of some sort they are working on? GA

Jim, I don't know, but I will talk with our people that are working with Babbages. We haven't set the price firmly on it. So there really isn't any concrete info, just speculation on their part.

<[Host] ST.LOU> Three more questions, folks.

Re the Cable thing...well it's this way. If you follow the San Jose Mercury News (which is the hot paper in the silicon valley), one day the cable multimedia thing is the hotest thing going,

the next day it's over-rated. We're talking with a number of people about it. But so far it's just talk. ga

<[Host] ST.LOU> Ken Stevens is here. Welcome, Ken.

<[Ken] K.STEVENS1> [A[A[D[DBob, one more question on the Jag CD. With the potential release of the Sega Saturn (64 bit with built in CD Rom) in late 94, how will that affect the release of the Jag CD? Thanx....GGGGGAAAAA!!!

<[Host] ST.LOU> Bob, ignore those /sends for now :-)

Ken, it depends on what version of Saturn they release. :) At first they said that it was a 32 bit machine, now they are saying 64 bit. Actually, it really isn't going to impact Jag CD at all. We're of the opinion that the Jaguar offers the best of both worlds. The Jaguar carts are faster than CDs, and hold the most data of any cart system in the world!! ga

<[Host] ST.LOU> G.SAUNDERS is next.

3DO Crash and Burn has "CD-ROM lag"; how will the Jag avoid this problem?

<[Host] ST.LOU> Then Matt Rivman will wrap it up for us.

I played that at a "Nobody beats The Wiz" today and noticed the same thing. Two ways, #1 Double speed, #2 Cache. There won't be much noticeable slowdown. If you have seen other CD games, you've seen the "LOADING" message on the screen. We don't need that. :) ga

<[Host] ST.LOU> OK, my buddy Matt Rivman has the last question for tonight.

<[Matt] M.RIVMAN1> Bob, I just wanted to know what I can go back to my local Babbages and tell them in reply to their statement that Atari short-shipped their distributor?? And will Atari be sending 'pro's' to the stores to demo like 3DO did? (oops! thats2)

Great to have friends, eh Matt? First of all, Babbages doesn't have a distributor. They deal directly with us. Second of all, it appears that they are shipping around the country, not just to NY and San Francisco. That's not what they were supposed to do. And I guess you missed my opening remarks, I'm in NY visiting retailers all this week. I guess that makes me a pro like 3DO. :) ga

<[Host] ST.LOU> Whew! A record number of questions _and_ we managed to hold a contest in the middle! Bob, thanks for taking the time, once again, to bring the latest Atari news to GEnie's ST RoundTable. I hope our guests enjoyed the evening. I sure did! I look forward to the January edition which will likely be moved off the long weekend (I hope). Actually, it will be on the 7th, right? Anyway, it was great to have Bob and Ron online with us tonight. Have a great holiday

season with your families. GA

Once again, I have enjoyed our time together here on our official online service, GEnie. These Dateline: Atari! Sessions have become a monthly event that I truly look forward to each and every month. It's been wonderful to see the high level of interest in the RTC each month! That's a tremendous source of encouragement to me as I prepare for it!!! Thank you once again for attending, and may you all have the most wonderful holidays ever! Goodnight, and thank you!!!

GK> or
GK> A gouraud-shaded 3D polygon animation in 16bit-color

In HAM8 the polygon will have to use the same colour when shading, in 16bit you can have a "rainbow" shading if you like.

It's also impossible to put this gouraud-shaded polygon on top of other HAM8 graphics, while we Falcon owners already have several gouraud-shaded polygon demos on top of TC graphics .. :-)

GK> What is faster?

16bit ofcourse, you only have to use one move.w instruction for each pixel, and you don't have to calculate anything extra at all.

GK> A gouraud-shaded 3D polygon animation in HAM8 on A1200 without fastram
GK> or
GK> A gouraud-shaded 3D polygon animation in 16bit-color on F030 without
GK> fastram

The 4096 colors (don't really understand where it comes from, but never mind)
is a local limitation. You can have lots of different groups of different 4096
colors on the screen. 65536 colors is a global limitation.

Yeah, I remember. And Amiga 1200/4000 machines were supposed to be getting
a DSP board (AT&T 3210) and it never happened. :)

I remember advocating the Falcon and never saying it would out-sell the A1200,
only that it would be a better machine.

(and even then I meant that from my own perspective, and didn't try to play
dictator and force my view on the rest of you... )

Speaking of which, where is the DSP for the Amiga?

SB> for the machine.

Yup .. this was impressive until I read a post from a guy in
rec.games.video.misc (where we all should move this console debate...)

Pinball Fantasies is one of the bundled games in Canada .. which means that
those sales-figures aren't really telling us anything about real sales ..
(Commodore just bought a lot of Pinball Fantasies ...)

Your friends are probably very rich by now though .. ;) .. Pinball *.* are
really good! (I'm just pissed noone did them for STE ... or rather, they have
been done but not released ... (also heard 21 century did a Falcon version))

I will probably stop debating consoles here, the debates in
rec.games.video.misc are far better (although there's another Amiga fool trying
to convince everybody that the CD32 has better hardware than both the 3DO and
Jaguar .... full-screen mode7 rotations at 50fps on ECS Amigas are one thing
I've seen posted there.. laughter ... )
I heard a rumour about the 3DO .. seems that programmers have stepped outside
the OS a few times to do some special effects not possible if you don't hit the
hardware direct .. ;) .. so much for compatibility .. :-DDD

I just read a few posts stating that Commodore has lost over $300 million and has less than $8 million in cash (or assets). I'm sorry I can't remember the sources, but some are saying that Commodore may be going out of business. For you netters out there, does anyone know if this is true?

I've been hearing a lot of this lately, and I'm wondering whether or not it is really true or just rumor.

If so, what does that mean for the Amiga and the CD32?

> +-------------------------------------------------------------------------+

How can people be so stupid and ignorant. I simply can't believe it!
Shall I really answer to that crap? Donley never answerd my mails with the
Jaguar specs...
So the Jaguar's 68000 at 13Mhz has 9 MIPS! Hell, I didn't know that! It's rated
at 0.8 MIPS for 8Mhz. So by adding some tiny Mhz you blast the performance
of that chip 10 times.
The 16 Mips DSP in the falcon can handle an MPEG at 12Fps. I have seen it!
Now take a 26 Mips DSP. How many frames? 19.5Fps. Hmm that's not 30 Fps...
Well ok, but look at that crappy Sega-CD. It does only 15 or 10Fps and people
say 'Oh, great' :-).
Well let's use your calculation:
If we add some tiny Mht to the 16Mips DSP, we multiply the performance by 10.
So there you are, the Jaguar has a 160Mips DSP. If this is not enough to do
a 120 Frames per second MPEG.
The CD32 AGA chipset can do nothing special except decompressing 60 times per
second an HAM8 picture to a 24 bit display. This looks poor compared to the
Jaguars graphic chipset which can render thousands of polygons, gouraudshade
or texturemap them and put tonns of sprites on screen at the same framerate.
Do you think the 3MIPS 68020 will compensate for that?
HAHAHAHA!!!!
And besides, what the hack will I do with Starwars as background for Lemmings?
This is bullshit.

The Jaguar supports Cinepak, which is high enough quality for game grafix.
I watch my movies on a Laserdisk! Not on a crappy MPEG with lots of non-moving squares on screen.

Now, Mr Donley, you succeded in convincing me even more of the Jaguar. AND you managed to make me hate everything what has to do with CD32.
Nice job!
You are the king!
You are alone.
Have fun with your crap games...
I'll go and get my Jaguar in Paris.

Georges.

Hmmm... I'm no Amiga/CD32 freak, but I thought Amigas were pretty
popular in Europe. How could C= be going out of business with a
successful line of computers. But then again I don't know what they do
with their money...

Probably not much.

I imagine that atari will post a loss like 3do and commodore have.
Why? Because all three companies have been shelling out a lot
of R&D money and money to start production and haven't started to
get any return yet.

These fiscal losses for this quarter will probably not affect any of
these companies in the long term.

>So it is quite possible to achieve FMV on the Jaguar.

How? The maths don't work out. If the Falcon's DSP is 16MIPS, and only
decompresses a 160x120 MPEG stream at roughly 12fps, how would a 26MIPS
DSP possibly do a four times larger stream at 25fps? The Jaguar would need
128MIPS to do the job. It does not have that kind of power, obviously.

Being a former Atari employee, I can tell you that they didn't have any
sort of
User Interface standard until just last year. From what I saw of their
standard,
it is very similar to the Macintosh guidelines with a few minor
exceptions.

but
> not many!)

As for your idea, I disagree. I agree with letting the user decide
whether or not
they want confirmations, I don't agree with letting the users have
complete control
over the dialog box buttons, etc. Its too much and it also changes the
semantics of
the GUI on that machine. Once you give users that level of control, you
take away
the ability of people to learn one macintosh and know how to use them
all. This is
a fairly important concept in my opinion.

Anyway, that's just my personal opinion..

I think the stock market speaks for itself. Atari has a potential product in Jaguar. What does Commodore have? PC Clones? The Amiga? CD32? I don't think so. The Amiga's days are quickly coming to an end (just as Atari's ST line is coming to a close as well), PC Clones can be had at lower prices than Commodore can make them, and CD32 is a waste of time.

The only real market that Commodore has is Video Toaster type work on Amiga. That's it. And let me tell you, that isn't enough to sustain Commodore.

As for your comment, I would rather be with a down-sized company like Atari with alot of potential than with a company that has no real product potential and losses in the $300 million area. Remember, bigger ships are ALWAYS harder to turn around.

>

Don't count on it. Atari has already weathered the storm. I think they
will show a
small profit in the Q4 of 1993 and a larger profit in Q1 of 1994.

They have downsized their company and cut the operating costs down over
the last
year. I think they are poised to show a profit soon.

As for 3DO, I don't know about them. They appear to have spent much more
R&D money
than Atari did. They may have to rack up some substantial sales to get
their money
back.

I agree with your opinion. It sort of devalues a graphic standard to have it
be different on different machines...

P.S. Good to see you here! Hopefuly your levelheadedness will help around
these parts...

Ironically, StarFox has been selling for $40->$50 in some places here,
when other cartridges go for more. I think it has to do with the
smaller ROM usage of StarFox (I think it's only 4 mega-bits).

True. But the funny thing is that the CD-32 has been selling already quite
well. How come 50,000-60,000 Pinball Fantasies for the CD-32 have been
sold already (from Stefan).

|> The Falcon's DSP at 16Mips (24bit) can decompress an 160x120 MPEG with 12FPS.
|> So it is quite possible to achieve FMV on the Jaguar.

You must be joking. The DSP in the Falcon was rated around 20MIPS. ATARI rates its system with a peak of 55 MIPS if I remember correctly.

12FPS != 30FPS (the one with the MPEG, the Video CD standard)

320x200 is 4 times the resolution of 160x120. So 4 times x 2 (to achieve 24fps) = 8 times more power than 20 MIPS. That is 160 MIPS- the Jaguar can?

No, NOT FROM ME!

Now read:

I WAS TALKING ABOVE ABOUT 4096 COLORS FROM THE PIXEL ON THE LEFT, NOT ON
THE SCREEN. GOT IT?

ON SCREEN IS AT LEAST 256 * 1024 COLORS (or those that fit). And since
you get the 24-bit palette advantage, of course it looks better than the Falcon's
'True COlor.'

No, it wasn't just CD-ROM for the ST. They were thinking about doing
the CD-I idea but with the ST. Not a CD-I stand alone machine, but they
also wanted to put enciclopedias with pictures, etc. THEY DIDN'T
DO ANYTHING, AND COULD HAVE BEEN THE FIRST TO MARKET THAT.

I do give them credit, but that doesn't mean I have to say:

" Gee, look, the world's have been saved, just buy a Jaguar " attitude.
Atari has a looonng race before them, and I am skeptic.

When you said that ATARI's off to a good start in this race, I'll say
that they got the proper shoes, the proper attire, the proper attitude.

The race for all systems has just begun...

I think this is just YAUR (yet another unfounded rumour). Main reasoning
is CD-32 sales, and agreement with Hewlett Packard, etc. Now, if the
lawsuit deal is true... but I highly doubt it.

I don't know about that - one would have to agree that the most
important thing for Commodore or Atari to do is Advertise, Advertise,
Advertise. You gotta have money to advertise... Atari has about $40
Million set aside for the national Jaguar launch.

: small profit in the Q4 of 1993 and a larger profit in Q1 of 1994.

: They have downsized their company and cut the operating costs down over
: the last
: year. I think they are poised to show a profit soon.

Uh, yeah, with what?!?

As of right now, they only sold A FEW THOUSAND of Jaguars. Only god knows when the rest will be released BECAUSE OF THE STINKIN FAULTY SWITCHBOX! And I'd suppose TV networks let Atari air their commercials for free, and magazines include their ads just for the hell of it?

Profit? What profit? Red ink BIG time... Only a week before christmas. Unless a miracle takes place, Atari won't see any profits till well into next year, probably 2nd/3rd quarter '94.

I'd expect both 3DO and Atari stocks to drop well into next year. Atari has fallen more than 42% since it's height while 3DO dropped about 33% since it's height, with Atari hanging around 7 and 3DO at around 31...

Heja Kristofer,

I've seen the Amiga CD32 run with a CD-Video module (FMV) and that's the
best piece of video I've seen. Both the picture and the sound quality is
better than anything I've seen before. And beside than, the FMV is using
less than 5% of the AmigaCD 32's power.

Simply - The Amiga CD32 will set the new standard for Computer games!

: What? The Amiga OS does it all the time.

I wish it were true, but sorry... The heaviest use of copper in the Amiga OS
is for the screens. That means that a maximum of 256 colors are set for each
screen visible. But if you calculate a bit, you find that 64 colors times
256 scanlines will end up being a bit more... And the copper can't change
64 colors completely outside the visible part of each scanline - it simply
isn't fast enough. The copper is nice for background rasters and other
non-intensive tasks requiring precious timing, but not for heavy work.

Regards, Kristofer.

MultiTOS is a fully preemptive multitasking OS - soon to be Posix compliant. No hacks whatsoever!

If you want to talk about hacks ... lets talk about the Amiga OS ... so-called Multitasking ..

Commodore and Cadtrak settled out of court. The settlement
wasn't anything even remotely resembling $30M.

You're basing this completely upon an article with "Subject: gaming/jaguar news",
whose first two paragraphs basically say Jaguar's better than 3DO, 3DO's having
financial problems, and Commodore lost money and a lawsuit and is going out of
business. Then it follows with pages of Atari marketing BS. Yeah, I'd
believe every word of it.

> I've been hearing a lot of this lately, and I'm wondering whether or not
> it is really true or just rumor.
>
No, it's just not true. Yes Commodore did lose money last year like some other
computer companies did, but they won a recent lawsuit and supposedly paid off
the $30 million they owed Prudential.

> If so, what does that mean for the Amiga and the CD32?
>
CD32's doing well in Europe and Australia, just had an NTSC version production
run for World of Commodore Toronto last weekend, and the MPEG module either
just started production or supposedly will be next week.

Commodore has flirted with bankruptsy a number of times in the past.
The rumors don't even phase me any more. If they were truely going out of
business (which isn't the case at this moment), then it would mean the Amiga
and CD32 would be dead. It's pretty simple. :)

The point is that during animation, large parts of the data are totally redundant. Although VHS reproduces every frame, the inherent quality of the frames is poor. MPEG has been designed around how the eye percieves video, so despite the `loss` of data, the picture is still good. Certainly of VHS quality, tho not of SVHS or LD quality.

I agree, C= has grossly overpriced the A4000 line. They really are
ripping off dedicated Amiga users by pricing these machines so high.
Still, at least Amiga owners can buy 040 Amigas with expansion slots, eh
Falcon owners?

Yes, body blows galactic DOES have a special AGA version.

I agree with earlier comments - many AGA games are pretty dissapointing
because they are simply tarted up versions of ECS games. What I want to
see is software that could ONLY be done on AGA, but I would guess that
there will have to be around 500000 AGA amigas before the software
houses take the plunge for AGA only software - with 1.5 million ECS
amigas in the UK, they would be forsaking a lot of potential sales.

I am encouraged by the way that many new games look for extra memory and
then give you more sound samples, or take advantage of the A1200s faster
CPU to give a smoother update. And of course, since the A1200 will run
ALL current ECS games, us A1200 owners have a LOT more choice than the
poor sods who bought a Falcon.

Lots of seemingly healthy companies go out of business. Look at
all of the software company deaths in the 80s (ie. Epyx, Activision,
Cinemaware) ... many came as a complete surprise.

Commodore has a successful line of computers in Europe, but
they've lost lots of money in the States ... perhaps these two markets
cancel each other out? They also seemed to lose a LOT of money on the
CDTV. In addition, we're in a recession and (as far as I've seen)
Commodore hasn't attempted to restructure it's operations like other
companies.

I hope they don't go out of business. To see them or Atari go down
would mean less alternatives available for the DOS platform and Apple is
still too expensive for me! The Amiga has a large enough following that
short term effects on software creation would probably be minimal.

That's my two cents worth:

Well, there are a *few* Falcon only games and via the PD prog, Backwards, Falcons can run quite a few ST, STe Games. I've certainly run quite a few on my Falcon, some work faster, some need to run at 8Mhz.

Just where exactly are these arcade jaguars? oh, i see - they just
licensed the option to use the chipset. Thats very different from such
a thing actually existing.

You really are full of shit. Why are you always making things up to make
Atari products sound good. Anytime you SEE an Amiga you just have to
claim that your Atari does x or y an 99% of the time you are shown to be
making it up. You really have lost ALL credibility. You have spent the
last few months arguing that the jaguar does this or that and YOU DONT EVEN
HAVE ONE! You already talk about the Jaguar CD as if it exists and it
could be months before it comes out.

Face it, the Amiga BURIED the ST, the A1200 killed the Falcon stillborn,
but what will probably kill the Jaguar is Ataris own inept marketting.
This would be a great pity as the Jaguar looks like a very good machine -
certainly in pure technology terms it beats the CD32. In all probability

it will go the way of the lynx and the falcon - death by obscurity. If by some chance it does survive and prosper with next-generation games, then I will certainly buy one. I`ll also have a CD32 drive for my A1200 and will be buying software for it.

If you feel pissed off for having wasted money on a falcon which has no games software, then by all means buy a Jaguar but dont come running to me if it turns out to be another in the long line of Atari flops. Stick to the facts instead of making stupid , untrue claims and you will get a lot more respect.

On AGA, it is not necessary to change the colors during the
non-visible area of the screen. You can change 64 registers (say
numbers 64-127) during the visible area of the screen, and with one copper
instruction, tell Lisa to switch to using colors 64-127 instead
of 0-63. Basically a bank switch of the color registers.
There aren't enough copper cycles to change 63 per line, however.

I would venture a guess that if Commodore did indeed go
out of business (which I have no idea if it is probable)
that another company would pick up the Amiga support.
The user base is just too large to let it drop (especially
in Europe). I would even say that if Atari went under
(NEVER!) that their computer line and game system
(Jaguar) would still be supported. Just look at the talk
of Atari clones since Atari's computer support has been
cut back.

> Can you say: DSP? :-)

Yep: "Dee-Ess-Pee". That doesn't help though, since the Jag DSP doesn't
have much more computing power than the 25MHz 68040 does. It certainly
does not have 8 times the power of the '040, which would be required.

Well, firstly the DSP is a Zorro-machine-only card, so it was never
intended for the A1200. Secondly, I don't think the lack of a DSP is
much of an issue. I certainly don't miss it.

>Speaking of which, where is the DSP for the Amiga?

Licensed to a third-party company. It's been more or less finished
for more than half a year. DSP boards from other companies (Sunrize
for example) have been available for a long time, BTW.

>(Commodore just bought a lot of Pinball Fantasies ...)

Well, I'm sorry but these figures were from the middle of November,
and the bundled copies are not included. Also, I remembered incorrectly,
the correct figure is between 30,000 and 40,000 copies.

>Your friends are probably very rich by now though .. ;) .. Pinball *.* are
>really good!

Oh well, they've made "some" bucks, but they didn't get a very good
deal with 21st Century royalty-wise, unfortunately (half of what we get
from T17). The development team was also relatively big, so they haven't
really made a lot each. Still, they're not exactly poor, either.

> (I'm just pissed noone did them for STE ... or rather, they have
>been done but not released ... (also heard 21 century did a Falcon version))

No Falcon version has been made, at least not according to the boys at DI.

>On the CD32, people just copy old games onto a CD.

True to some extent with the initial CD32 titles, but the more recent
titles are much better. Have a look at Liberation or Microcosm for
example - those are *HUGE*. Our own CD32 titles in development are enhanced
a great deal from the computer versions, as well (more levels, more graphics,
more sound and so on).

>On the Jaguar (no matter if the game's a port or not) they will have to

They don't have to re-write it much more than you would for a SEGA
port for example. You could take the Amiga version of a game, and just
rewrite the display and sound functions. That's one of the reasons the
68000 is in the Jag - to simplify ports.

[stuff removed]

Well, according to the Atari RTC on GEnie a week or so ago, the have replaced
the faulty manual switchbox with an automatic switchbox. This is the cause
of the delay in more jags being shipped. Atari shipped the 2nd batch with
the auto. switchbox on Monday or Tuesday of last week (Dec. 6th or 7th).
Therefore stores should be getting them in anytime now.... and please don't
forget this is still the TEST MARKET. Atari is test marketing to find the bugs
and get them worked out...and I believe they've handled the RF-box problem
very well. (If you have a faulty rf-box you can call atari up, and they will
send you free of charge an auto-switchbox, a Composite cable, or S-video cable.)
I think that's pretty good customer service.
George

It lost $356 million. Unlike billion dollar operations like DEC and IBM,
that kind of loss is devistating for Commodore.

)>So it is quite possible to achieve FMV on the Jaguar.
)
) How? The maths don't work out. If the Falcon's DSP is 16MIPS, and only
)decompresses a 160x120 MPEG stream at roughly 12fps, how would a 26MIPS
)DSP possibly do a four times larger stream at 25fps? The Jaguar would need
)128MIPS to do the job. It does not have that kind of power, obviously.

The Falcon can decompress a 320x200 MPEG at 12fps.

The Falcon has a different DSP than the Jaguar, so you cannot compare
MIPS.

The Jaguar uses Cinepak to do FMV without an MPEG cart - you have to
have an MPEG cart to play MPEG movies.

)
) WHAT? You must be kidding me, are you? There's a lot of people
)that connect their SEGAS and S_NES to stereos (include me in there).
)How come a 'next generation 64-bit system' doesn't have that when
)it costs $250? THINK.

A lot of us on the net might, but we mostly have techie kinda friends
- I'll bet that 80% or Sega's and Genisi are just hooked to a TV.

)
)|> )|> As for the ST CD, well you can just get any 'ol SCSI CD-ROM and hook
)|> )|> it up to an ST. True that there are not a lot of ST specific CD-ROms,
)|> )|> but I can use photo-CD, or DTP CD stuff.
)|> )
)|> ) No NO NO! I am talking about back in 1986 when ATARI was proposing
)|> )doing something like CD-I is attempting today. At that time, THAT
)|> )would have sold.
)|> )
)|>
)|> Hmm, I thought it was just a CD-ROm for the ST's, I hadn't heard about
)|> anything like a CD-I machine.
)
) No, it wasn't just CD-ROM for the ST. They were thinking about doing
)the CD-I idea but with the ST. Not a CD-I stand alone machine, but they
)also wanted to put enciclopedias with pictures, etc. THEY DIDN'T
)DO ANYTHING, AND COULD HAVE BEEN THE FIRST TO MARKET THAT.

Oh Well... No one will deny that Atari's past managment of the
company has been less than sterling!

)
)|> )|> ) I has potential, and ATARI *seems* to be doing the right moves...
)|> )|> )that's one thing...
)|> )|> )
)|> )|> ) But again, one thing is racing half the race and make it to the
)|> )|> )goal, and another is racing half the race and come out in the last place.
)|> )|> )
)|> )|>
)|> )|> But Atari's off to a good start in this race, instead of sitting at
)|> )|> the gate trying to tie their shoelaces like the usually do.
)|> )
)|> ) True, doesn't mean they won the race though.
)|> )
)|>
)|> But it means they are still in it - there are people who won't even
)|> give them that much credit.
)
) I do give them credit, but that doesn't mean I have to say:
)
) " Gee, look, the world's have been saved, just buy a Jaguar " attitude.
)Atari has a loooonng race before them, and I am skeptic.
)
) When you said that ATARI's off to a good start in this race, I'll say
)that they got the proper shoes, the proper attire, the proper attitude.
)
) The race for all systems has just begun...
)

I'll accept that.

:#re-write it, making the possibility of added features likely.
:#Understand now?

HAHAHA. So, now you're admitting some Jaguar games will be ports? What
happened to your statement that ALL Jaguar games will be NEW?

Let's see a re-write (i.e. port) of a software onto a new machine has a
possibilitiy of added features sounds like what I said with A1200 games
ported to CD32. Ported games will possibly have added features.

Rickard do you always talk out of the side of your mouth?

:#"many more months" has still not been officially confirmed, although I find it
:#likely that Atari wants to wait until they can back it with software.

Stefan said they were informed by Atari. Why don't you get some "official"
information then from Atari. All I keep hearing from you is hype. Where
are your "official" statements? Where's the "official" statement that
ALL games on the Jaguar will be NEW and not just ported?

)
)Just where exactly are these arcade jaguars? oh, i see - they just
)licensed the option to use the chipset. Thats very different from such
)a thing actually existing.

That's right, you shure woulnd't cath them licensing yesterdays
technology like the CD-32.

)
)You really are full of shit. Why are you always making things up to make
)Atari products sound good. Anytime you SEE an Amiga you just have to
)claim that your Atari does x or y an 99% of the time you are shown to be
)making it up. You really have lost ALL credibility. You have spent the
)last few months arguing that the jaguar does this or that and YOU DONT EVEN
)HAVE ONE! You already talk about the Jaguar CD as if it exists and it

)could be months before it comes out.
)
(aimed at CD-32 posters in general [some exceptions])
You really are full of shit. Why are you always making things up to make
Amiga products sound good. Anytime you SEE an Atari you just have to
claim that your Amiga does x or y an 99% of the time you are shown to be
making it up. You really have lost ALL credibility. You have spent the
last few months arguing that the CD-32 does this or that and YOU DONT EVEN
HAVE ONE! You already talk about the JCD-32 as if it exists and it
could be months before it comes out.

)Face it, the Amiga BURIED the ST, the A1200 killed the Falcon stillborn,
)but what will probably kill the Jaguar is Ataris own inept marketting.
)This would be a great pity as the Jaguar looks like a very good machine -
)certainly in pure technology terms it beats the CD32. In all probability
)it will go the way of the lynx and the falcon - death by obscurity. If by
)some chance it does survive and prosper with next-generation games, then I
)will certainly buy one. I`ll also have a CD32 drive for my A1200 and will
)be buying software for it.
)

Death by obsurity can only be the fate of the CD-32. In case you
missed every news item about the Jaguar and 3DO, the media loves the
Jaguar. Atari is actually advertising the Jaguar. Good 3rd party
companies are developing for the Jaguar.

)If you feel pissed off for having wasted money on a falcon which has no
)games software, then by all means buy a Jaguar but dont come running to me
)if it turns out to be another in the long line of Atari flops. Stick to
)the facts instead of making stupid , untrue claims and you will get a lot
)more respect.
)

My Falcon runs almost all of the STE game software I hvae - all I care
about, at least. I have plenty of games for my Falcon... You should
stick to the facts instead of going out on a limb as usual.

)>JC> No, I think he meant it's still vapourware. We can talk vapourware
)C
)>JC> you
)>JC> want but, if it don't exist then it don't hold a candle to something
)that
)>JC> does exist.
)>
)>Ah yes .. the PowerPC is also vapourware ... and Windows NT .. and ... e
)c ...
)The Jaguar is finally making it out in SMALL quantities - the Jaguar CD
)is still nothing but vapourware. Are you really STUPID , or maybe you
)
)have one and noone alse does?
)

The Jaguar CD is a lot more than vaporware - as you state below,
Return To Zork is currently under development - do you think it will
fit in a cart?

Are you really STUPID, or what?

)
)>The company (don't remember their name) stated themselves they are devel
)ping
)>Return to Zork for the JagCD ... isn't that enough?
)>
)woooo - return to Zork! What a heap of SHIT. Check out the reviews in
)PC magazines - nice gfx, but NO GAME
)

My opinion of this game too - but there are other things under
development.

Your last comment (nice gfx, but NO GAME) applies to 99% of Amiga
games I've played (Killer Game Show for instance - yech!), and thus
99% of CD-32 software.

)
)>Then you obviously have problems reading my posts ..
)
)>On the CD32, people just copy old games onto a CD.
)
) True to some extent with the initial CD32 titles, but the more recent
)titles are much better. Have a look at Liberation or Microcosm for
)example - those are *HUGE*. Our own CD32 titles in development are enhanced
)a great deal from the computer versions, as well (more levels, more graphics,
)more sound and so on).

I don't know about Liberation, but Microcosm is a port - it is also
out for CDI, and I think planned for 3DO.

Actually, here's what I think will happen with games like Microcosm
and such - they will be ported to just about any system with a CD
player (yes, even the Jaguar), because most of the work for those
large CD-ROM things goes into developing the graphics. The code will
be ported across machines (relativly cheap compared to the sound and
graphical parts), and these large games will be availiable for many
platforms.

)
)>On the Jaguar (no matter if the game's a port or not) they will have to
)>re-write it, making the possibility of added features likely.
)
) They don't have to re-write it much more than you would for a SEGA
)port for example. You could take the Amiga version of a game, and just
)rewrite the display and sound functions. That's one of the reasons the
)68000 is in the Jag - to simplify ports.
)

Oops, didn't see this part before, looks like I agree with you about
this. I hadn't even thought about that aspect of the 68K - I guess it
would make ports eaiser.

I was watching a CDi demo the other day in a mall, and I did see some
of Microcosm - the FMV stuff looked cool, but does anyone know what

kind of game this is?

"The official statement as of Brodie's latest roundtable is
"summertime", that can be anything from June to August .."

I thought the latest timetable on the Jag CD was September (of '94).

The CD is obviously used to read the data, and the CPU is used to
decompose the MPEG stream into video and audio parts. So the CD32
hardware is used, although not for rendering the image.

Uhm... Yes I know a fair bit about DSP programming. I also know how MPEG
works. I still stand for my statement that the Jaguar does not have the
processing power that is required. If it had, I'm sure Atari would have
let us know by now.

>JC> happened to your statement that ALL Jaguar games will be NEW?

><puke> ... I said that all Jaguar games will be written *FOR THE JAGUAR* ..
>Do you have serious problems reading that?

Uhm.. Of course all Jaguar games will be witten for the Jaguar. I don't
think anybody expected Jaguar games to be written for the SNES and somehow
still work ... Saying that is like kicking in open doors. The point is that
most Jaguar games will still be ports just like the games for all other
platforms.

>JC> Let's see a re-write (i.e. port) of a software onto a new machine has a
>JC> possibilitiy of added features sounds like what I said with A1200 games
>JC> ported to CD32. Ported games will possibly have added features.

>Don't even TRY to tell me that A1200 games are being RE-WRITTEN for the CD32
>... the correct name is COPIED ...

Blah, blah, blah. What's the difference? As long as the game is released
on the CD32 format it's a CD32 game. A game is not worse because it's
available for the A1200 as well as the CD32, or is it? Are you saying that
the fact that is in easy to port a game from A1200 to CD32 is a NEGATIVE
thing? That's funny, you know. In my opinion it's a BIG plus.

>The official statement as of Brodie's latest roundtable is "summertime", that
>can be anything from June to August ..

Well, he said "around mid 1994". That's still about six months away.

This is because people keep claiming that the CD is so much better
than the cart - but if a lot of games are only taking up 14mb or so of
CD-ROM space, then they can be released on a cart just as easily.

Plus, If I had a CD system, I would only buy games that took real
advantage of the medium - if you just want computer games, then buy a
computer.

I'm pretty much unbiased, although obviously not entirely so since
I have quite a lot of time and money invested in Commodore equipment ;-)

However, what I said is true. Atari has very little money right now, but
Commodore is not exactly healthy either.

Simple: if Commodore is going out of business, how come they have
started hiring programmers again?

Don't be silly guys, when a company is not doing well, they don't
hire at all.

[another ignorant posting courtesy of Rickard]

Rickard, it is this simple: ATARI THEMSELVES said that their MIPS
is 55. This is probably even a BEST CASE.

Now, I don't think 55==128, is it?

Good humor. The Amiga has had multitasking since 1986. I don't think
that at this level (OS 3.0 soon to be 3.1) in 1993 it can be called a hack.

Where can we start? I made a list of them already.

|> GM> woooo - return to Zork! What a heap of SHIT. Check out the reviews in
|> GM> PC magazines - nice gfx, but NO GAME
|>
|> That wasn't the issue. (And BTW; I *LOVED* the text-versions, I just WANT it
|> ....)

The text versions are good. The graphic versions MIGHT NOT BE GOOD.
Does it absolutely without a doubt HAS TO BE GOOD? That doesn't mean anything.

I have Star Raiders I, and I bought Star Raiders II. I expected
Star Raiders II to be way better, which turned out to be totally wrong.

You don't learn at all do you? What did Stefan said? They are making
games for the CD-32 which are not like the A1200's.

The first batch however, is more like what you suggest.

Can't you understand the difference?

Kendall, I don't want to sound harsh, as we have been carrying a nice
conversation so far. But what's different today from the ATARI past management?
The CD-ROM for the ST idea came from the Tramiel's. Today's ATARI is run
by... Tramiels...

I give ATARI the chance, though, I don't want to sound like I am already
against them. All I wanted to say is that I am skeptic, as there are many
people and we have excellent reasons to be.

But I give them the chance. They have apparently made a very good
piece of hardware, and so far have been doing the 'right moves'.

Well, considering that the ST software is usually a subset of the Amiga
software, then there's even less for the ST right?

Kendall, I don't know what games have you played, but a lot of games
on ALL computer systems suffer from this.

14 megabytes >> 6 megabytes...

|>
|> Plus, If I had a CD system, I would only buy games that took real
|> advantage of the medium - if you just want computer games, then buy a
|> computer.

Kendall, NOT ALL GAMES have to take all the CD-ROM. This must explain
what I call the 'multimedia type games.' Games that are poorly designed,
'just because we got a CD-ROM so we can put all the graphics and sound
we want.'

Take Turrican: put that on CD-32, add a CD-quality soundtrack and
that's it. It is a very good action game. Maybe do cinematic sequences,
but what else you want?

When you hit options, you see a 3 minutes animation? He he...

I hope you get my point ;-)

: -scott tirrell

Yeah ... don't be phased by it. Atari has also seemed doom-ridden
for the last few years and they always found a way to survive. I think
Commodor will pull through. Both Atari and Commodore have been shelling
out a lot of dough in support of their machines. They may be sporting
losses now, but that will probably translate to big profits in the future.
I hope they both clean up!

>> MR <<

I'm especially impressed with Atari. For the first time in years,
it looks like they're actually doing something that the Trammiels hate ...
spending money and caring about their customers. If this is a sign of the
new Atari, perhaps I'll support them again!

What's different? They advertise, they support customers, they build
real distribution networks. That is what really impresses me!!

I don't know why they ditched the CDI idea (they can't have been too
serious though - I'm a pretty avid ST fan and I never heard of it
before!!), but they seem real determined to carry through on the
Jaguar. I have seen no signs of the classic Atari screwups of the
past. A paranoid person would almost think that Atari engineered the
whole bad RF box thing just to show people the level of support they
are giving the Jaguar!

)software, then there's even less for the ST right?
)
) Kendall, I don't know what games have you played, but a lot of games
)on ALL computer systems suffer from this.

That's right - most computer only games are rather bad (with some exceptions). That is why I am dubious of the quality of many of the CD-32 games, which seem to be ports from the Amiga. I would feel the same about Jaguar games if they mostly came from the ST or DOS world.

I know there will be exceptions (there are some games that look good for the CD-32, like Liberation (now that is a CD game! I mean why would you buy some silly port when you could get that for the same price!) or perhaps Microcsom (The CDI demo of this looked cool, but I have no idea what the game is really like).

The Jaguar on the other hand will get less of the computer ports, and more console type software with good playability. Cybermorph sounds good, and I'm also eagerly awaiting Raiden (I play this a lot in the arcades).

To sum up, even though the CD-32 may enjoy a larger number of releases right now, I don't think all of them will be worth purchasing, bringing the number of quality titles down around to the numer availiable for the 3DO or Jaguar.

Actually, my opion of the CD-32 has improved over time - but I haven't seen the level of support in America that I have for the Jaguar, and

also another worrysome thing to me is that CD-32 games have different versions of PAL and NTSC games - this could leave American purchasers out in the cold for many releases. (please correct me on this point if I am wrong, this is mainly based on stuff I heard in r.g.v.m).

)|> )must be 100MB+, or it's crap? I just don't get it.
)|>
)|> This is because people keep claiming that the CD is so much better
)|> than the cart - but if a lot of games are only taking up 14mb or so of
)|> CD-ROM space, then they can be released on a cart just as easily.
)
) 14 megabytes >> 6 megabytes...

Well, I was thinking of compressing the graphics to fit it into 6MB or less.

)
)|>
)|> Plus, If I had a CD system, I would only buy games that took real
)|> advantage of the medium - if you just want computer games, then buy a
)|> computer.
)
) Kendall, NOT ALL GAMES have to take all the CD-ROM. This must explain
)what I call the 'multimedia type games.' Games that are poorly designed,
)'just because we got a CD-ROM so we can put all the graphics and sound
)we want.'
)

Some are, but they don't have to be that way. Stuff like Dragon's Lair, or Liberation are examples of what CD games can be.

) Take Turrican: put that on CD-32, add a CD-quality soundtrack and
)that's it. It is a very good action game. Maybe do cinematic sequences,
)but what else you want?
)

Well, I would perhaps like more levels, or more graphics and sound thrown in. Sonic CD is my idea of a good CD port - lots more levels to play in and better sound (I think).

) When you hit options, you see a 3 minutes animation? He he...
)

Well, maybe between levels of something... :-)

) I hope you get my point ;-)
)

I get your point but still disagree with it. Iy somehow leaves me chilly all over to think of so much wasted space on a CD... ;-)

Actually, one other thing they could do is put a bunch of games on one CD - that would seem to be a pretty good use to me.

They're selling all A4000's they produce. Wouldn't it be very stupid to lower the prices in that case?

We had several discussions among Atari-freaks about the possibility to do a modfile player (Paula emulator) on the Falcon's DSP. The opinions were from 'very fast' to 'impossible to do'. I myself estimated the DPS's cpu usage to 50% to emulate Paula. Now, there are emulators wich use only 8% of the DSP and produce a 50Khz 16bit sound in stereo.

First rule:
Never underestimate good coders!

Second rule:
There are no good coders on PC.

Of course I wanted realtime rendered polys! Of course you as an amiga user had
to point somwhere out that it's nicer and faster on Amiga. Especially rendered
pictures are great in HAM8.
But if you want to do realtime 3D...

Georges.

There have been plenty of companies out there that have relied on 3rd party companies to supply parts for products and have had problems. In this case, the good news is that Atari has taken fast steps to correct the problem. (If you don't believe me, check out CompuServe, look for Don Thomas' post. Don is Director of Atari Customer Relations). The switch box problems are pretty much solved. I don't think that will affect the release of the rest of the product.

Atari is spending its money carefully. Any good company with a clue would do the same. They are running their ads at carefully selected times, in selected markets, and during shows where the target market is watching. If you aren't between 10-17 and male, then you aren't in the target market for video games. Sorry, live with it.

> Profit? What profit? Red ink BIG time... Only a week before christmas.

I suspect that you are wrong about the Red Ink comment. But neither I nor
you can
prove our statements. I guess we will have to wait and see. But,
considering that I
personally know the people there and have been involved with the company
for the
past 5 years, I think I know alittle more about Atari than you do.

> I'd expect both 3DO and Atari stocks to drop well into next year. Atari

3DO at 31? Hello? This morning I showe is at 24 1/2. Atari
is at 7. The bottom
line is that both companies are challenging much larger companies (Sega
and
Nintendo) that have alot of money and huge marketing efforts. It is an
uphill battle for both and a HUGE risk for investors.

The 128 MIPS figure is a guess, not a very good one either.

MIPS = meaningless ... take this as an example:

(Figures quoted from the Motorola DSP56001 handbook)

The DSP56001 runs at 16MIPS, 96MOPS.

You know the difference between MIPS and MOPS right? No? Ok...

On a normal processor (680x0 for example) one instruction usually means 1-2
operations .. on a RISC (or DSP) that is not the case .. usually one
instruction is between 4-6 operations ..

So, when dealing with GOOD programming, you can easily go WAY above the "MIPS"
figures.

(And if the Falcon's DSP does 96 MOPS .. .ehrm ... I think you get it.)

Please get some information before posting.

Port or not, the issue was that CD32 games needn't be "just" A1200
floppy games dumped onto a CD. Neither of those two games are likely
to appear on A500 or A1200.

>Actually, here's what I think will happen with games like Microcosm
>and such - they will be ported to just about any system with a CD
>player (yes, even the Jaguar), because most of the work for those
>large CD-ROM things goes into developing the graphics. <...>

Certainly. That's what I think too. That doesn't mean the games get
worse though.

>I was watching a CDi demo the other day in a mall, and I did see some
>of Microcosm - the FMV stuff looked cool, but does anyone know what
>kind of game this is?

Some sort of shoot-em up inside a human body. I haven't seen it in
person either, but the graphics are supposedly very good.

Neither company died. Both companies ran into serious financial
problems. Epyx filed chapter 11 of the bankruptcy code, which is
a request for protection from creditors during reorganization, NOT
the death of the company. Epyx has been alive ever since it was
first incorporated under the name of Automated Simulations.

Activision did not die. It was renamed MEDIAGENIC for a time, but
new management in '91 wisely named it back to Activision. They also
saved the the company.... The new management are gaming fanatics.
The Chairman and CEO Bobby Kotick just turned 30.

I've been there since '88.

See the PC WEEK/INSIDE article titled "Busy Going Hollywood" for details.

Kendall Helmstetter Gelner (kendall@great-gray.owlnet.rice.edu) wrote:
:#In article <1993Dec13.043012.27016@rchland.ibm.com> ricardo@rchland.vnet.ibm.com
(Ricardo Hernandez Muchado) writes:
:#) Well, considering that the ST software is usually a subset of the Amiga
:#)software, then there's even less for the ST right?
:#) Kendall, I don't know what games have you played, but a lot of games
:#)on ALL computer systems suffer from this.

Some Amiga games did originate on the ST, DM is a classic. This was when
the ST were doing very well. Now it seems the games come out first on the
Amiga then drift towards the ST.

:#That's right - most computer only games are rather bad (with some
:#exceptions). That is why I am dubious of the quality of many of the
:#CD-32 games, which seem to be ports from the Amiga. I would feel the
:#same about Jaguar games if they mostly came from the ST or DOS world.

I'm also dubious of the quality of Jaguar games. There will no doubt be
good ones among the numerous bad ones.

:#I know there will be exceptions (there are some games that look good
:#for the CD-32, like Liberation (now that is a CD game! I mean why
:#would you buy some silly port when you could get that for the same
:#price!) or perhaps Microcsom (The CDI demo of this looked cool, but I
:#have no idea what the game is really like).

People will buy ports of a game because: 1) they didn't purchase the game
for another machine, 2) game is enhanced, or 3) no longer have the game and
want to get another copy since it was a good game. Just because a game is
a port doesn't mean it is going to be terrible. Usually the good games get
ported, though there have been some bad games ported. Most developers are
not going to bother porting a game that hasn't done fairly well.

:#The Jaguar on the other hand will get less of the computer ports, and
:#more console type software with good playability. Cybermorph sounds
:#good, and I'm also eagerly awaiting Raiden (I play this a lot in the
:#arcades).

This is only opinion on your part. Until the games actually start coming
out, you won't know what the percentage of new games vs. ported games will
be.

:#To sum up, even though the CD-32 may enjoy a larger number of releases
:#right now, I don't think all of them will be worth purchasing,
:#bringing the number of quality titles down around to the numer
:#availiable for the 3DO or Jaguar.

Let's see, none of the CD32 games that are already released are in my collection of games. So, quite a few might be worth purchasing. I've already set my sights on Pinball Fantasies, Microcosm and quite a few others (haven't seen any of these games as yet but everybody's talking about them).

:#Actually, my opion of the CD-32 has improved over time - but I haven't
:#seen the level of support in America that I have for the Jaguar, and
:#also another worrysome thing to me is that CD-32 games have different
:#versions of PAL and NTSC games - this could leave American purchasers
:#out in the cold for many releases. (please correct me on this point
:#if I am wrong, this is mainly based on stuff I heard in r.g.v.m).

Considering the CD32 hasn't been released for America is no surprise that the level of support (developers) is lower than the Jaguar. Though the level of support worldwide for the CD32 in comparison to the level of support for the Jaguar is overwhelming.

:#you have serious problems reading that?

I have problems with people who twist what they post. You had specifically
said that the Jaguar games will not be ports, hence all Jaguar games have
to be games that are not released on other machines. This means NEW games.

:#JC> Let's see a re-write (i.e. port) of a software onto a new machine has a
:#JC> possibilitiy of added features sounds like what I said with A1200 games
:#JC> ported to CD32. Ported games will possibly have added features.

:#Don't even TRY to tell me that A1200 games are being RE-WRITTEN for the CD32
:#... the correct name is COPIED ...

Try ported. Not exactly re-written as Stefan said but modified or ported.
Let's see if I copy a 5 MB game from an A1200 game and I come out with a
110 MB game, that's copied? Gee, I wonder what's the other 105 MB.

:#JC> Stefan said they were informed by Atari. Why don't you get some
:#JC> "official"
:#JC> information then from Atari. All I keep hearing from you is hype. Where
:#JC> are your "official" statements? Where's the "official" statement that

:#The official statement as of Brodie's latest roundtable is "summertime", that
:#can be anything from June to August ..

Let's see I can get a CD games console now, but the Jaguar CD won't be out
til "summertime"? About 6-8 months too late.

:#JC> ALL games on the Jaguar will be NEW and not just ported?

:#You really must be STUPID.

Is that the best you can come up with? I usually consider people that
resort to name-calling to be people with either little intelligence or very
childish. Which do you fit?

Sure. And alle humans will be friends. The sun will also shine at night now.
All Jaguar games will be absolutely new games with totally new ideas...
Stupid! No one has ever asserted such thing, nore is anything of the above
reasonable.
As you (should) know: for example all Accolade-titles for the Jaguar will
be ports of their games, but all will be entirely new written. Do you
imagine why? Well, there are 5 processors never used in any preceding
system and the 68000 is NOT the main CPU.

Do you really think that in 6 months people will be able to use a totally
new CPU with a totally new concept?
It's not easy to get into DSP stuff, but it is worth the effort.
And there are DSPapplications out there. They use it mostly for sound effects.
But some demos already show what is possible in non-sound domains...

The DSP is used for JPEG unpacking in quite a few graphics progs and in many
music progs including PD ones.

The whole point really is that the big sellers will be games - the
multimedia 'Experiences' will only be a fraction of the sales. From
a games point of view the media has little to offer - other than
increased space. There is no guarantee they will do anything useful
with it..
I do not think that games will suddenly change to
being adventures of a lifetime or whatever - just more levels to
guide Sonic around... with prettier sound.

>)
>) Kendall, NOT ALL GAMES have to take all the CD-ROM. This must explain
>)what I call the 'multimedia type games.' Games that are poorly designed,
>)'just because we got a CD-ROM so we can put all the graphics and sound
>)we want.'
>)

>Some are, but they don't have to be that way. Stuff like Dragon's
>Lair, or Liberation are examples of what CD games can be.

Can't imagine why anyone would say that Dragon's Lair was a good
example. It's an example of gameplay, lasting interest and real
fun being sacrificed for piles of graphics and some hype selling
you a sub standard GAME (?). More likely you look at the pretty
graphics a few times - complete the game and leave it on the shelf
for evermore...

Too much storage space encourages crap programming practice (Look
at the unjustified size of some PC games), a tendancy to overuse
flash graphics and sound at the expense of gameplay, and of course
in the case of CD gives the manufacturers something NOT that much
better to hype and sell at a vast profit...
Alot of really great games produced over the last few years have not
required vast memory space... I don't know about you but alot of the
games I come back to time and time again are in fact fairly simple but
well designed - with an addictive quality. Sure some flight sims etc
require a large graphics storage medium, but more often than not this
is only because the producer could not be bothered to implement any
compression techniques on the data...
Anyway - CD is not so superior to Cartidges particularly with respect
to the production of decent games... in many ways it may be detrimental...

Much Sound + Much Graphics != Great Game

BUT it sure can shift alot of units before anyone is brave enough to
admit they have been conned!

>) Take Turrican: put that on CD-32, add a CD-quality soundtrack and
>)that's it. It is a very good action game. Maybe do cinematic sequences,

Sod the waste of space - can I have a great game?

>Actually, one other thing they could do is put a bunch of games on
>one CD - that would seem to be a pretty good use to me.

Yep, Worthwhile once their useful shelflife as an individual product
is over... People go and buy it again!

>--
>---> Kendall Gelner (kendall@rice.edu)

I think Atari's decision to stick with Carts for the Jag at first is
fair enough - though they may have to jump on the CD bandwagon pretty
quick in order to get a good market share. They are obviously hoping
to shift enough units at first on the mines bigger than yours 64bit
thing... But that can't last forever...
Seem's like the Jag will be a good product though - all they have to
do is influence people to buy it.!

Later,
Colin.

I guess what is mean't is that all games will be newly developed for the
jags architecture etc. They will hardly not port popular games to the
Jaguar - That would seriously shoot you in the foot. I Guess the point is
that simple A1200 games will be ported to the CD-32 with nothing much added.
Sensible considering the size of the software base available...

# 3645. PCW review - Jag/3D0

Newsgroup: comp.sys.atari.advocacy
Date: 1993-12-14 16:18:06 UTC
From: Craig.Graham@newcastle.ac.uk
Message-ID: <CI19A7.1M7@newcastle.ac.uk>
Source record: 19681

Just read a review in PCW comparing the Jaguar & the 3D0 - Jag wins.

This was a 'leading edge' type of article on the next generation of games consoles. Say's that the 3D0, whilst being technologically good, has naff games, where-as the games they tested on the Jag. were WILD.

(Comment: CD32 wasn't even considered in the running due to it's already out of date spec....., so they didn't bother to review it)

Flame Flame Flame Flame

Craig.

:#|> It's not easy to get into DSP stuff, but it is worth the effort.
:#|> And there are DSPapplications out there. They use it mostly for sound effects.
:#|> But some demos already show what is possible in non-sound domains...
:#The DSP is used for JPEG unpacking in quite a few graphics progs and in many
:#music progs including PD ones.

Someone did email me that Chagall uses it. It's good to see that at least one program does utilize it but, I'd been expecting a lot more uses for it. I keep seeing a slew of things that might be possible but, there still seems to be a lack of software to put the DSP through its paces.

6 months should have been enough time for development, more than enough since developers had Falcon development manuals months in advance of the actual Falcon release, right?

:#Sure. And alle humans will be friends. The sun will also shine at night now.
:#All Jaguar games will be absolutely new games with totally new ideas...
:#Stupid! No one has ever asserted such thing, nore is anything of the above
:#reasonable.
:#As you (should) know: for example all Accolade-titles for the Jaguar will
:#be ports of their games, but all will be entirely new written. Do you
:#imagine why? Well, there are 5 processors never used in any preceding
:#system and the 68000 is NOT the main CPU.

So, you mean all games on the Nintendo, Gameboy, Genesis, etc. are not ports? According to your definitions all of those games are NEW. That means all games coming from the Clone market into the 68000 market are new by your reasoning also and not ports. New ideas doesn't mean diddly if those games were already done on other machines, which to me is defined as ported.

Do you know what CPU stands for? You can keep harping about the other processors all you want but I can't believe a graphics processor is the CPU, why don't we keep mixing up computer terminology some more while we are at it.

:#>:#You really must be STUPID.

:#Yeah. Right he is.

In that classification I guess you're just as informed as Rickard. It's a good thing that not all Atari advocates are like the two of you.

:#Sensible considering the size of the software base available...

What is meant and what was said by Rickard was different things entirely.
He said Jaguar games will NOT be ports. I agree with your view except
maybe with the last sentence. There will be some game ported from the
A1200 -> CD32 with not much added, like the Lotus stuff with is a bundle
package with no enhancements if I recall, but most others will have things
added to differing degrees. The amount added is debatable as to what will
be good and what's just fluff.

:#The fact is that most games would have changed beyond recognition if that
:#105Mb was usefully used... Fact is - It isn't usefully used. And also I
:#would seriously doubt that the full capacity of the CD would be used
:#anyway in most cases. You would have to make some serious changes to fill
:#up 105Mb.... Or alot of pointless ones...

Adding a CD soundtrack would be considered useful to some. Adding extra
levels, more graphics, etc might be considered also useful to others. The
amount added will vary as I've always implied.

:#It will only make a difference on the Mine is Bigger than Yours front...
:#but this maybe easily offset by some well directed 64bit marketing initially,
:#but in the end atari will be forced to jump on the CD bandwagon.

No, the difference is that Atari had a chance to actually make something of
the Jaguar if they had put the CD drive on it. Releasing it without a CD
drive is bad enough but having to wait at least 6 more months for a CD
drive, why?

:#NO COMMENT on the above.... never even needed to argue about it - just apply
:#a minimal amount of common sense.

Was only being applied to Rickard since when he can't seem to debate about
it he resorts to a very immature state.

>I have problems with people who twist what they post.

I have problems with people who complain about things they have never seen or used before. (I am not saying you are one of these people...)
ie Jaguar is better than 3DO, 3DO is better than Jaguar etc etc etc

>:#JC> Let's see a re-write (i.e. port) of a software onto a new machine has a
>:#JC> possibilitiy of added features sounds like what I said with A1200 games
>:#JC> ported to CD32. Ported games will possibly have added features.

>:#Don't even TRY to tell me that A1200 games are being RE-WRITTEN for the CD32
>:#... the correct name is COPIED ...

A game is rewritten to run on the available hardware. In your example, "extras" such as better graphics are added to make it different enough for people to want to buy it, and because the machine is capable of better graphics.
The same game on two or more platforms is "copied" because they are the same game, whether or not the versions are simply ported or written from scratch independently of each other. A case of misunderstood meanings I think...

>Try ported. Not exactly re-written as Stefan said but modified or ported.
>Let's see if I copy a 5 MB game from an A1200 game and I come out with a
>110 MB game, that's copied? Gee, I wonder what's the other 105 MB.
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
1. Just because a game is on a CD it doesn't mean the CD is full up
Just think how 3-4 games can be put on one cartridge when they were originally released separately.

2. Maybe it's the extra graphics + sound. This must take up a lot of space.
How much difference it makes and what it adds to the game is debateable but it depends on the quality.
ie a good, playable game _can_ have crap graphics or sound.
also, good, fancy graphics and sound doesn't necessarily mean a good game.

>Let's see I can get a CD games console now, but the Jaguar CD won't be out
>til "summertime"? About 6-8 months too late.

Err, too late for what? (I hope I am not missing something...)
You could get a MegaCD, but it won't come close to jaguar or 3DO.
You could get a 3DO if you have the extra cash to spare.
Or you could get a jaguar now and play cartridge games until the CD comes out.
Seeing as there have been CD units on show, it probably means developers have access to everything they need to make games available for when the CD unit is finally on sale. Isn't this the most important thing?
Why buy a CD player when there is nothing to use it for?

Source record: 19686

In article <CI0Dro.3qK@news.Hawaii.Edu> jimmy@Hawaii.Edu (Jimmy Chan) writes:
)Kendall Helmstetter Gelner (kendall@great-gray.owlnet.rice.edu) wrote:
):#In article <1993Dec13.043012.27016@rchland.ibm.com> ricardo@rchland.vnet.ibm.com
(Ricardo Hernandez Muchado) writes:
):#) Well, considering that the ST software is usually a subset of the Amiga
):#)software, then there's even less for the ST right?
):#) Kendall, I don't know what games have you played, but a lot of games
):#)on ALL computer systems suffer from this.
)
)Some Amiga games did originate on the ST, DM is a classic. This was when
)the ST were doing very well. Now it seems the games come out first on the
)Amiga then drift towards the ST.
)

Yes, I do think the ST game market has declined. It's not dead yet,
though.

):#That's right - most computer only games are rather bad (with some
):#exceptions). That is why I am dubious of the quality of many of the
):#CD-32 games, which seem to be ports from the Amiga. I would feel the
):#same about Jaguar games if they mostly came from the ST or DOS world.
)
)I'm also dubious of the quality of Jaguar games. There will no doubt be
)good ones among the numerous bad ones.

Well, of the games announced so far for the Jaguar, the ones I am most
interested in are Cybermorph, Raiden, and of course AvP. I agree that
Cresent galaxy seems to have poor gameplay, but Humans looks good (if
you like that kind of game). So far, only one that really sems to
have poor gameplay! That's pretty good so far.

I think that if you get a whole bunch of computer ports, that
you'll get a lot more poor games - computers just plain have a lot
more games with poor gameplay. Some of these games even sell well, if
they have enough flash - and those will be ported too.

)
):#I know there will be exceptions (there are some games that look good
):#for the CD-32, like Liberation (now that is a CD game! I mean why
):#would you buy some silly port when you could get that for the same
):#price!) or perhaps Microcsom (The CDI demo of this looked cool, but I
):#have no idea what the game is really like).
)
)People will buy ports of a game because: 1) they didn't purchase the game
)for another machine, 2) game is enhanced, or 3) no longer have the game and
)want to get another copy since it was a good game. Just because a game is

)a port doesn't mean it is going to be terrible. Usually the good games get
)ported, though there have been some bad games ported. Most developers are
)not going to bother porting a game that hasn't done fairly well.
)

The danger I see is that too many games will just be put onto the CD
with little enhancement at all.

):#The Jaguar on the other hand will get less of the computer ports, and
):#more console type software with good playability. Cybermorph sounds
):#good, and I'm also eagerly awaiting Raiden (I play this a lot in the
):#arcades).
)
)This is only opinion on your part. Until the games actually start coming
)out, you won't know what the percentage of new games vs. ported games will
)be.
)

From the initial list, it looks pretty good so far!

Actually, I'd also differentiate between ports of arcade/console games
(which have good gameplay), and computer games (which tend to have
poor gameplay). So I really don't consider stuff like Raiden a "port"
as such, because it was already in the same realm (stand alone game
machine).

):#To sum up, even though the CD-32 may enjoy a larger number of releases
):#right now, I don't think all of them will be worth purchasing,
):#bringing the number of quality titles down around to the numer
):#availiable for the 3DO or Jaguar.
)
)Let's see, none of the CD32 games that are already released are in my
)collection of games. So, quite a few might be worth purchasing. I've
)already set my sights on Pinball Fantasies, Microcosm and quite a few
)others (haven't seen any of these games as yet but everybody's talking
)about them).
)

From the list I saw, an awful lot of the games were ones I wouldn't be
interested in...

):#Actually, my opion of the CD-32 has improved over time - but I haven't
):#seen the level of support in America that I have for the Jaguar, and
):#also another worrysome thing to me is that CD-32 games have different
):#versions of PAL and NTSC games - this could leave American purchasers
):#out in the cold for many releases. (please correct me on this point
):#if I am wrong, this is mainly based on stuff I heard in r.g.v.m).
)
)Considering the CD32 hasn't been released for America is no surprise that
)the level of support (developers) is lower than the Jaguar. Though the
)level of support worldwide for the CD32 in comparison to the level of
)support for the Jaguar is overwhelming.

)

Well, I meant stuff like press coverage and so on - even before the
Jaguar or 3DO were released, they had good press coverage of their
machines on different programs. Why hasn't Commodore been trying
to get coverage like that.

):#can be anything from June to August ..
)
)Let's see I can get a CD games console now, but the Jaguar CD won't be out
)til "summertime"? About 6-8 months too late.
)

Too late for what? In the meantime the Jaguar will be out for ~$200, a good price point to invade homes, and sell a lot of units - then even if only 50% of the machine owners get CD-ROM's, you wiould still have a large user base of CD-ROM owners. That's the main advantage I see to a seperate CD-ROm, is that it lets the base console have a lot better market penetration.

:#jimmy@Hawaii.Edu (Jimmy Chan) writes:
:#>I have problems with people who twist what they post.

:#I have problems with people who complain about things they have never seen or
:#used before. (I am not saying you are one of these people...)
:#ie Jaguar is better than 3DO, 3DO is better than Jaguar etc etc etc

I've never claimed any console is better than the other. It's just a
matter of what features that are included and what's not. Features such as
a CD drive.

:#A game is rewritten to run on the available hardware. In your example, "extras"
:#such as better graphics are added to make it different enough for people to
:#want to buy it, and because the machine is capable of better graphics.
:#The same game on two or more platforms is "copied" because they are the same
:#game, whether or not the versions are simply ported or written from scratch
:#independently of each other. A case of misunderstood meanings I think...

Copied means that something is duplicated exactly with nothing added.
While ported means that a software is modified to run on another platform.

If someone has different meanings, please feel free to post it.

Rickard had stated before that Jaguar games will not be ports. I'm holding
him to his words.

:#>Try ported. Not exactly re-written as Stefan said but modified or ported.
:#>Let's see if I copy a 5 MB game from an A1200 game and I come out with a
:#>110 MB game, that's copied? Gee, I wonder what's the other 105 MB.
:# ^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
:#1. Just because a game is on a CD it doesn't mean the CD is full up
:#Just think how 3-4 games can be put on one cartridge when they were originally
:#released separately.

I have stated in a couple of previous posts that there was at least one
company including a bundle package of games, Lotus racing games (I think).
There were 3 in the series. I've never said there wasn't something like this
being done.

:#2. Maybe it's the extra graphics + sound. This must take up a lot of space.
:#How much difference it makes and what it adds to the game is debateable but it
:#depends on the quality.
:#ie a good, playable game _can_ have crap graphics or sound.
:#also, good, fancy graphics and sound doesn't necessarily mean a good game.

I've always held this point of view. I can include previous postings which
I've always stated that the amount of "added stuff" is debatable and
doesn't always mean good. Same goes for less. But, if you add extras to
an already good game, it will be a little hard to make it any worse, though
it is possible, and you have a better chance of making an already good game
better.

:#>Let's see I can get a CD games console now, but the Jaguar CD won't be out
:#>til "summertime"? About 6-8 months too late.
:#Err, too late for what? (I hope I am not missing something...)

It's too late for my purchasing requirements.

:#You could get a MegaCD, but it won't come close to jaguar or 3DO.

No doubt.

:#You could get a 3DO if you have the extra cash to spare.

Only if it comes down drastically in price, by about $100-$300.

:#Or you could get a jaguar now and play cartridge games until the CD comes out.
:#Seeing as there have been CD units on show, it probably means developers have
:#access to everything they need to make games available for when the CD unit is
:#finally on sale. Isn't this the most important thing?
:#Why buy a CD player when there is nothing to use it for?

The earlier the CD player is out the earlier games will be released for it.
My requirement of a game console that I plan to buy was that it had to have a
CD player for it. I've mentioned this a couple of times, ask Kendall.

<some stuff deleted>
)>)
)>)|>
)>)|> Plus, If I had a CD system, I would only buy games that took real
)>)|> advantage of the medium - if you just want computer games, then buy a
)>)|> computer.
)
)The whole point really is that the big sellers will be games - the
)multimedia 'Experiences' will only be a fraction of the sales. From
)a games point of view the media has little to offer - other than
)increased space. There is no guarantee they will do anything useful
)with it..

Actually, I kinda see the Experiences picking up steam eventually.
They interest me, anyway.

)I do not think that games will suddenly change to
)being adventures of a lifetime or whatever - just more levels to
)guide Sonic around... with prettier sound.
)

That's exactly what I want - more levels, better graphics and sound.
I'll get some of that with the increased cart size of the Jaguar, more
of it with the Jag CD.

)>)
)>) Kendall, NOT ALL GAMES have to take all the CD-ROM. This must explain
)>)what I call the 'multimedia type games.' Games that are poorly designed,
)>)'just because we got a CD-ROM so we can put all the graphics and sound
)>)we want.'
)>)
)
)>Some are, but they don't have to be that way. Stuff like Dragon's
)>Lair, or Liberation are examples of what CD games can be.
)
)Can't imagine why anyone would say that Dragon's Lair was a good
)example. It's an example of gameplay, lasting interest and real
)fun being sacrificed for piles of graphics and some hype selling
)you a sub standard GAME (?). More likely you look at the pretty
)graphics a few times - complete the game and leave it on the shelf
)for evermore...

Well, I liked it when it was in the arcades - although it was too
expensive to play much. but it was enjoyable... My desire to buy a
3DO is even a bit stronger now that I read about the DL adaptation...

though the huge price keeps me at bay!

)
)Too much storage space encourages crap programming practice (Look
)at the unjustified size of some PC games), a tendancy to overuse
)flash graphics and sound at the expense of gameplay, and of course
)in the case of CD gives the manufacturers something NOT that much
)better to hype and sell at a vast profit...

It's ok to be a little loose with space if you have enough to go
around - it's not called wasetful programming, it's called allocation
of time to worthwhile efforts. A CD game developer doesn't have to
care as much about how to cram graphics in the game. The only reason
some PC game sizes are considered unjustified is that you use the HD
for something eles vesides the game.

)Alot of really great games produced over the last few years have not
)required vast memory space... I don't know about you but alot of the
)games I come back to time and time again are in fact fairly simple but
)well designed - with an addictive quality. Sure some flight sims etc
)require a large graphics storage medium, but more often than not this
)is only because the producer could not be bothered to implement any
)compression techniques on the data...

That is true - that's why a lot of great cart games can be released in
addition to the CD ones for the Jaguar. :-) I think my favorite games
ever are Dungeon Master, Oids, and perhaps Civilization.

Just imagine a CD version of DM III or something - now that would be
fantasic!

)Anyway - CD is not so superior to Cartidges particularly with respect
)to the production of decent games... in many ways it may be detrimental...
)
)Much Sound + Much Graphics != Great Game
)
)BUT it sure can shift alot of units before anyone is brave enough to
)admit they have been conned!

The CD does allow the production of good games with a lot of stuff
though. That's the stuff that belongs on CD. The simpler games can
go on a cart. I even see a future for combined cart+CD games.

)
)
)>) Take Turrican: put that on CD-32, add a CD-quality soundtrack and
)>)that's it. It is a very good action game. Maybe do cinematic sequences,
)>)but what else you want?
)>)
)
)It was a great game before CD....
)

I never said anything about Turrican!

)
)>Well, I would perhaps like more levels, or more graphics and sound
)>thrown in. Sonic CD is my idea of a good CD port - lots more levels
)>to play in and better sound (I think).
)
)Still a great game.... costs more for very little effort on the part
)of the producer. In fact CD's are probably cheaper for them to
)produce..? Cynical! - Who, ME?
)

I don't know if it cost them a lot less - they had to add the extra
levels. That's what makes the CD games end up with the same price as
the carts - it's all in the development costs.

)
)>) When you hit options, you see a 3 minutes animation? He he...
)>)
)
)>Well, maybe between levels of something... :-)
)
)>) I hope you get my point ;-)
)>)
)
)>I get your point but still disagree with it. Iy somehow leaves me
)>chilly all over to think of so much wasted space on a CD... ;-)
)
)Sod the waste of space - can I have a great game?
)

Sure! That's all I want too.

)>Actually, one other thing they could do is put a bunch of games on
)>one CD - that would seem to be a pretty good use to me.
)
)Yep, Worthwhile once their useful shelflife as an individual product
)is over... People go and buy it again!
)

Well, that is a good point. Actually, come to think of it, I don't
want to buy a collection of games that no-one wants... That's what
ends up in those packs anyway.

)>--
)>---> Kendall Gelner (kendall@rice.edu)
)
)
)I think Atari's decision to stick with Carts for the Jag at first is
)fair enough - though they may have to jump on the CD bandwagon pretty
)quick in order to get a good market share. They are obviously hoping
)to shift enough units at first on the mines bigger than yours 64bit
)thing... But that can't last forever...

)Seem's like the Jag will be a good product though - all they have to
)do is influence people to buy it.!
)

I myself will be a Jag owner (soon, I hope - damn those fools at FAO Sw.!!)

I think you have the impression that I dislike the Jag or something -
At times I felt like I was arguing against myself! I just see a place
for CD games and a place for cart games. That's why I'll buy the Jag
CD too when it comes out. In the meantime, there are more Jaguar
games coming out that look good than I can afford anyway, so I won't
have an availiablity problem.

):#would seriously doubt that the full capacity of the CD would be used
):#anyway in most cases. You would have to make some serious changes to fill
):#up 105Mb.... Or alot of pointless ones...
)
)Adding a CD soundtrack would be considered useful to some. Adding extra
)levels, more graphics, etc might be considered also useful to others. The
)amount added will vary as I've always implied.
)
):#It will only make a difference on the Mine is Bigger than Yours front...
):#but this maybe easily offset by some well directed 64bit marketing initially,
):#but in the end atari will be forced to jump on the CD bandwagon.
)
)No, the difference is that Atari had a chance to actually make something of
)the Jaguar if they had put the CD drive on it. Releasing it without a CD
)drive is bad enough but having to wait at least 6 more months for a CD
)drive, why?
)

The Jaguar is something, and 6 months is not a long time to wait.

When the CD come out, then the Jaguar will enjoy an advantage that
other systems do not - a cheap entry system, with CD as an add-on
later when you can afford one.

Also, as I've said before, there are some games that only need cart
sized space anyway, and there are games that need a CD-ROM's storage -
you can have both with the Jaguar.

NN> Epyx is still around too... They just aren't as big as they
NN> once were (due to the Lynx fiasco). Remember Chip's Challenge for
NN> Windows?

Ok, so it'a Atari's fault that EPYX isn't doing very well...

Get real.

News of the Jaguar is spreading like wildfire.

The CD32 OTOH, has been around longer, but heard less of.

Atari CREATED the videogame.

They are taking back what's rightfully theirs.

If the CD32 wants competition, look to the 3DO, not the Jag. The Jag
outperforms the CD32 in about every area.

Right now, I think that everyone will agree that C= and Atari are in
about the same shape financially. If the CD32 has sold as many as
everybody claims and is as good as everybody claims, then why isn't C=
making leaps and bounds over Atari?

All you Amiga users go whine somewhere else.

>those games were already done on other machines, which to me is defined as
>ported.

I see, you don't want to understand...
Many games for the CD32 will be just the A1200 games with some added
graphics and sound. The code remains unchanged, the game itself remains
unchanged. Look at the PC-market, all those CD-games are simply copies of
the Disk-games with more sound (or speech) and some graphics (finally there
is one exception: Rebell Assault is what I call a NEW CD-game).

All games for Gameboy, Genesis, SNES etc. must be totally new written.
That's not the case with A1200 to CD32 ports.

Another example: Many ST-games are ported from the Amiga in these days (well
there was a time this was vice versa). The "kernel" code of these games is
taken over without any changes. Most games don't use the special ST-Hardware
and were weak. That's the point.

>Do you know what CPU stands for? You can keep harping about the other
>processors all you want but I can't believe a graphics processor is the
>CPU, why don't we keep mixing up computer terminology some more while we
>are at it.

Oh, I don't want to start this discussion again...

Perhaps. But have a look at the very old Turrican II, which runs on an A500.
I don't think Sonic or Mario has anything like it in them. So, just because
games are written from scratch on the other games consoles, it does not
necessarily mean that the games will be better than the average (ported?)
CD-32 game.

This is just a reply to some of the Jaguar gripes and so on:

The Faulty Switchbox problem is no longer a problem. Atari has shipped more units to this area (Santa Clara/San Jose). It sucks that the company that provided the switchbox did not do an adequate job. However, Atari has probably done some of the best customer-support that they have ever done, in dealing with the problem.

I just got mine yesterday. Nice machine. It is sitting right next to my Sega Genesis (and it looks quite a bit more menacing).

I guess there is still only one game (Cybermorph). It is not a very have game, but is nice to look at (and more involved that it at first appears). The shading and rendering is very nice. (Not amazing, but better by far than Genesis/SNES). I think that the game shows some of the power on the Jag, as it does the graphics fairly quickly and smoothly.

The picture for the "Crescent Galaxy" game on the back box looks unbelieveable. It looks like a ray-tracing. The other pictures all look like real screen shots, so I suspect that this game is going to be a visual masterpiece.

The case looks nice. Has a cart slot on top, a power button on front, and two controller inputs on front (15 pin VGA type connectors). On the back is the RF out, the power connector, and a DSP and A/V output (card edge style).

Guess thats it. You people probably have heard this stuff anyhow, although I have not seen much besides bickering here (of course . . )

Overall, I am very impressed by Atari. The machine is very nice, looks good, the packaging is good. The only thing I am dissapointed by is the fact that the users guide does not list specifications of the machine (or sufficiently push the power it has). (Although the box does do some of this).

Thats all...

- mike

|> That's right - most computer only games are rather bad (with some
|> exceptions). That is why I am dubious of the quality of many of the
|> CD-32 games, which seem to be ports from the Amiga. I would feel the
|> same about Jaguar games if they mostly came from the ST or DOS world.

You don't get it do you? Most recent computer only games are
actually good. Actually, just before the S-NES came about, the
Amiga even had better games than the 'game consoles', I was just
referring to the fact that SOME computer games in ALL platforms
are bad.

But know, don't tell me that CinemaWare games (Rocket Ranger,
It Came From the Desert, etc.), Dungeon Master (FTL), Eye of the
Beholder (SSI/EOA), Ultima VII (Origin), Wing Commander (Origin),
Legend of Kyrandia (Virgin), etc. are bad.

Right now the Jaguar doesn't even have enough games, so you don't
know how many would come from the ST or Dos or even the Amiga world.

AND BTW, if the Jaguar was made into a computer, your argument
is totally pointless (actually, it already is).

The Jaguar doesn't have more than two titles right now, what are you talking
about. As for 3DO, almost the same goes.

|>
|> Actually, my opion of the CD-32 has improved over time - but I haven't

Maybe. It depends. I can play European games usually on my machine.
Now, the main problem would be getting a monitor, and in that regard
you are right.

|>
|> Second rule:
|> There are no good coders on PC.

You don't get it, do you? It's not a question of underestimating a good coder.
It is a question of saying something like:

"My old ATARI 2600 can surely do full screen animation in 160x200 with
video type images"

No matter how good the coders are, you have a limitation.

MPEG is not forgiving at all :-\

Guys, check this out! This from a person that 'has programmed on the Amiga?'

What did you program in? AmigaBasic? AmigaLogo?

Almost EVERYBODY that has an Amiga knows the machine has pre-emptive multitasking....

Spare me the speech. I very well know that, but I am using your
own 'ATARI bible specs.' I'm glad you mention this, because
this means that probably the '55 MIPS' Atari figure is just more hype.

|>
|> (Figures quoted from the Motorola DSP56001 handbook)

What about if some pople took that into account for doing their mark?

|>
|> (And if the Falcon's DSP does 96 MOPS .. .ehrm ... I think you get it.)

Well, then imagine, if the Falcon can't do mpeg well on 160x200, try
to imagine the Falcon in the 320(x2)x200.

|>
|> Please get some information before posting.

I got my information, thank you very little. You are the one
who dreams about '68030 w/ a 16-bit crippled data-path with burst mode'
of which you have proved nothing (and you have a Falcon and *supposedly*
you are a programmer...)

Oh yeah, SURE.... I forgot about THAT... so I guess that when ATARI had the ST CD-ROM it was already ready, as also was the pen computer, as also were the PC clones ATARI was showing in a booth at a CES (which never came out).

Yep, Rickard, thanks for enlightening me. NOT!

Well, saying that or not doesn't change it. IT DOES COMPETE. Now think about this: Why do you think 3DO/Panasonic are advertising against the Super Nintendo in their commercial? If this is a $700 vs $90 , imagine how easy to compete is for $700 vs $250...

Actually they are. CD-32 has sold far more (than the Jag.) and the
A1200 has sold far more than the Falcon.

What the hell have the Gx (graphics ?) routines got to do with POSIX compliance ? They're 2 completely different things. POSIX defines standards for portability between completely different architectures, defining intermediate level routines (eg: directory reading etc.) which aren't covered in libC. Graphics aren't touched upon.

Simon.

And what the hell what I was saying has to do against being POSIX compliant? I was talking about the multitasking on MultiTos.

Thanks.

I have Crescent Galaxy. I just picked it up today... SO far I am unimpressed.
I thought that CG would be a game like Gates of Zendacon for the Lynx. That was
a game that didn't recieve rave reviews but that had a depth of play that made
it fun once you got into it... so far CG DOESN'T.
I've played CG for all of 30 min. and so far it seems extremely easy. There ar
e five planets. (the planet shown in the commercials with the city is the final
planet) You can choose any of four planets and need to complete the four plane
ts before moving on to the final planet. SO far I have beaten two of the planet
s and I believe that I will finish the game by friday or saturday.
The graphics in the game are NICE. In fact, if the TGA files uploaded were don
e in their real resolution, then the graphics are at MAX rez on the Jag ( the C
Upid enemy that was uploaded took up the whole screen in the rez it was capture
d at, in the game, it takes up less than half the screen!). Again there is NO s
ound in terms of music... I liked that fact in Cybermorph... in Crescent Galaxy
it's annoying. There SHOULD be some really GREAT music, but in this even the s
ound isn't that good (so far not even a digitized word)...
I know that there will be some to take this as an opportunity to slam the Jag.
.. Oh well, that's too bad because this game is NOT an indication of the best t
he Jag can do. As Atari said themselves, it's only a 512k game (they claim that
all their first games will be 512k) and if this is true, a lack of music and d
igitized sound is understandable... ( in fact, Jag-basshers will probably jump

on me for saying the 512k is the size of the game)
Let me say though that Cybermorph is GREAT... gameplay, and fun factor are the
re... Also Let me say that I have played both the Laseractive and the 3DO... Cr
ash and BUrn didn't impress me... not because of the game or gameplay, but beca
use I don't really like driving games... the graphics are nice and all but... A
nd so far, the BEST LOOKING game is Pyramid Patrol for the Laseractive... The s
ystem generated graphics are terrible, but the spooled video looks REAL nice an
d is relatively smooth... I'd buy that for $300 or $400 but it's over $1000!
One game I can't wait to see though is Madden on the 3DO... looks to be the mo
st impressive game next to Park Place's 3D football for 3DO and Jag (although s
ome people have said that 3D football is terrible)... and I can't wait for a ga
me that comes across all the new platforms so that a true comparison of the gam
es and the systems can be made (Like Zool 2 will be released for both CD32 and
Jaguar... then we can compare them).
Enough of this talking... let me go. Gotta write two papers. One by tomorrow a
nd one for thursday.

Well, FAO Schwartz called last night with 25 copies of Crescent Galaxy,
so I had no choice but to
run (well, drive) up there and pick up a copy. Anyway, here are my
impressions...

Overview: Side scrolling shooter along the lines of ThunderForce 3, etc.
You start off with a choice
of four levels -- each of which has a space level where you shoot
alot of asteroids, and a planetside
level where you shoot alot of bizarre things (like CyberCherubs,
for example). You ship is equipped
with upgradable shots and bombs (unlimited) and 12 types of
special weapons. The special weapon
that is selected can be cycled through using the OPTION button,
or you can press the appropriate
keypad button to select it.

Sound: Poor. The music is, well, annoying. On the positive side, you can
turn it off (or down, even). The
sound effects are for the most part pretty uninspired.

Graphics: Good. At times, excellent. The bosses are nicely rendered
bitmaps, although a few more frames
of animation would have helped on a number of them.

Control: Decent. The ship doesn't quite leap to your commands, but it is
not sluggish either. Choosing the
special weapon is tricky as the icon showing which is selected is
fairly small (on a 25inch TV) and
they are hard to distinguish.

Gameplay: Decent. The difficulty level is average.

Overall: Probably worth having, but nothing special. It won't keep me
from playing Cybermorph.

-- John

Well, so far from what I have read and heard from a friend
of mine that played with it (hopefully I'll be able to contact
a guy around here that HAS IT):

* Nice controllers- are comfortable

* Nice design (case)

* Seems to have the power- the games, although not good, show
some potential

---

Just wanted to post this, don't want people to think I
am against the Jaguar or something.

# 3686. What's an Atari?

Newsgroup: comp.sys.atari.advocacy
Date: 1993-12-16 21:23:59 UTC
From: IO91624@MAINE.MAINE.EDU
Message-ID: <93350.162359IO91624@MAINE.MAINE.EDU>
Source record: 19618

They are like Nintendo machines, right? I notice in this group that Atari is targeting their marketing at 10-17 year olds. A posting in another Atari group says that Nintendo is a major competitor.

I suppose they must have good graphics and sound for the games. Are they good for anything else? They use 68000 chips. Are they compatible with Macs?

There can't be much software for them. Do they run Unix? Maybe you could compile the various freeware packages for them then, if they have a C compiler.

What about parts, upgrades? Must be very hard to find. They don't even sell Ataris around here. What do you do if your Atari needs service?

[Snicker, snicker. Ahem.]

What do they sell for?

Flames delightfully anticipated. Advocate your Atari, I'm listening.

Jeffrey L. Hayes IO91624@MAINE.MAINE.EDU

Elite opinion holds that a balanced budget amendment would place Congress in a straitjacket. Popular opinion holds that that's the point.

# 3687. Third Party Games for the Jag

Newsgroup: comp.sys.atari.advocacy
Date: 1993-12-17 00:14:20 UTC
From: mrathwel@herman.cs.uoguelph.ca
Message-ID: <2eqtks$o8t@nermal.cs.uoguelph.ca>
Source record: 19617

This has been a very interesting Debate to observe. I'd like to get a new game system in the future and am leaning towards a Jaguar. I confess, I am an Atari fan, but I also confess that I'm leary about pumping more money into them. Their tale of video game screw ups begins before the Lynx. I have an unsupported Atari 7800 system which Atari doesn't even sell games for anymore. After watching them spend a paltry $300,000 advertising it, announcing vapour-games left right and centre, discontinuing their support magazine, scaring away third party developers and being rude to me, I'm really suspicious.

However, the Jag has gotten off to a good start, and Atari seems to have seriously looked at their past mistakes. I'm seeing more Jag ads in the test market phase then I ever saw for the 7800 and the promise of real developers is there.

I'd like to know if the Jag third party developers have actually announced any games. A company can claim third party support, but if those developers don't make any games, a machine is screwed. Have any of these Thirty or so developers said what they're making for the JAG? If I see some good titles, I will be convinced.

Cheers:
>> Mark <<

# 3688. Re: What's an Atari?

Newsgroup: comp.sys.atari.advocacy
Date: 1993-12-17 02:03:34 UTC
From: STIRRE31@MAINE.MAINE.EDU
Message-ID: <93350.210334STIRRE31@MAINE.MAINE.EDU>
Source record: 19619

Hello Jeff,
I thought it would be good for me to answer your questions
because I am an Atari at UMO. First, yes, you are right,
there is no support around here. There used to be a local
dealer in Portland, but they went out of business.
In fact, I bought my Atari STe from a dealer in California.
And since Ataris never break :) , I won't need to get it
repaired. Well, okay, if it breaks, I'll get my Amiga
dealer to fix it (local) or send it to an Atari dealer.
Although the local support is not spectacular, there is
a lot of software for the Atari, mostly because it was
the most popular computer in Europe during the 80's.
The Ataris are based on the same microprocessors as the
Macs are. Moreover, there are ways to emulate the Mac
on the ST. All in all, the Atari ST is a fine computer.
A lot of Amiga advocates on this channel put down the
ST, but that can be expected on advocacy.
The reason there is a lot of talk of Nintendo lately
is because Atari has just released thhe world's first
64-bit game system, the Jaguar, which will be available
here (yes, here in Maine) early next year. it will be
available at Toys 'R' Us, Kay Bee, Electronics Boutique,
etc. So, go check it out.... you will be impressed (or
so I hear). HHopefully, Atari's new Jaguar will crush
the Super Nintendo.
Back to the computers.... yes, Atari still makes 'em.
The current model is the Falcon '030 based on the
Motorola 68030 microprocessor and has Digital Signal
Processing (the first affordable computer to have it).
The Falcon is an incredible computer, IMO. To get
more info, get an issue of Current Notes or ST Informer
(I recommend ST Informer).
Yes, I love Atari computers (I think that they are superior
to te competition). If you get a chance to use one, take
it. They are nice machines. And, yes, you can run Unix
shells on them, but you'd probably rather use the ST's
operating system, GEM (it is muchh better than Windows
and System 7, IMO).
If you want more info, e-mail me! Yes, I'm biased, but
you wanted advocacy!

:#..and how many CD32 games as of today uses 105Mb? (Hint, negative numbers)

Gee, quite a few them come with CD soundtracks, how much space do you
think that takes up? What about extra levels, better graphics, animation
sequences, etc. or are you saying that you've actually seen the CD32 games
without these? Okay, Rickard, name me one game on CD32 that can fit on 3-4
disks as you like to say. You must have some proof to your claims, right?
Or are you just blowing smoke? Now, remember it has to have everything the
CD includes to fit onto 3-4 disks.

If you can't answer this, please include yourself in your killfile..8-).

:#JC>Let's see I can get a CD games console now, but the Jaguar CD won't be out
:#JC>til "summertime"? About 6-8 months too late.

:#Let's see, I have a 64bit system with 32bit graphics, 16bit sound, special
:#hardware dedicated to effects like morphing, skewing, gouraud shading etc on
:#order ...

:#What has the CD32 got?

Software, CD drive, software, keyboard, software, drives, software, HD,
software, developer support, software, an operating system, software...etc.

Ricardo, don't you find Rickard's selective memory amazing..8-).

:#|> ...and how many CD32 games as of today uses 105Mb? (Hint, negative numbers)

:# He he... what about Microcosm?

I wonder if Rickard has actually seen the amount of information that is on
one of those CDs. I think he's making up stuff again.

I'm wondering how much ROM Cybermorph is. Can anyone with a Jaguar check?
Does it say, most or all SNES and Genesis catridges say how much ROM it
contains. I just curious to see if they are using all 50-60 Megabits.

Heiko Hartmann (higgi@yeti.faveve.uni-stuttgart.de.) wrote:
:#I see, you don't want to understand...
:#Many games for the CD32 will be just the A1200 games with some added
:#graphics and sound. The code remains unchanged, the game itself remains
:#unchanged. Look at the PC-market, all those CD-games are simply copies of
:#the Disk-games with more sound (or speech) and some graphics (finally there
:#is one exception: Rebell Assault is what I call a NEW CD-game).

Yes, many games will be A1200 games. And why not seeing as the Amiga CD32
is just an A1200 with CD drive and Akiko, minus other pheripherals on the
A1200. I've said this. What do you expect, rewrite the A1200 games
specifically for the CD32? There are also CD32 games that are will not have
an A1200 release. Such a game is Defender of the Crown 2. I don't think
you have even look carefully at the PC market. Not ALL the CD games are
available on disk, there are quite a few stuff that doesn't come on disks,
many of the new releases are CD only.

:#All games for Gameboy, Genesis, SNES etc. must be totally new written.
:#That's not the case with A1200 to CD32 ports.

Like Stefan said, they are not being rewritten. Mostly modified.

Since the Genesis uses a 68000, 68000 games get ported easier. The
graphics might have to be reworked and some other stuff but, in general the
code is very similar. Not sure about the others though since they use a
different chip. Hence, the games are not TOTALLY re-written. New means
you are starting from scratch with no previous stuff to draw from. You are
mincing terminology again. How, can you say new written, re-written
yes/maybe, new written no.

Jaguar has a 68000, guess what.

:#Another example: Many ST-games are ported from the Amiga in these days (well
:#there was a time this was vice versa). The "kernel" code of these games is
:#taken over without any changes. Most games don't use the special ST-Hardware
:#and were weak. That's the point.

Amigas and ST use the 68000 series. Moot point.

:#Oh, I don't want to start this discussion again...

Oh?

In article <93350.162359IO91624@MAINE.MAINE.EDU>, <IO91624@MAINE.MAINE.EDU> writes:
|> They are like Nintendo machines, right? I notice in this group that Atari
|> is targeting their marketing at 10-17 year olds. A posting in another Atari
|> group say that Nintendo is a major competitor.
I must admit, I first thought this might be a windup. You have really never heard of Atari? Atari were the original video game firm who started back in the early 70's with pong and later on (late 70's) released the 2600 console which used multichannel sound & color graphics to produce some damned playable games via carts. This machine sold like hot cakes and still sells even now - 15 odd years after it was released. After the console they released the 400/800 8bit home computers that were aimed at Apple IIs market and did quite well for a number of years. They were still sold until the late 80's AFAIK. In 1985 Atari released the ST series which is still sold now in an updated form and was originaly based around an 8mhz 68000 with hires mono and 2 color graphics modes. It was later enhanced upto 4096 colors, stereo sound and sample hardware. It was a competitor to the Apple Mac in theory and originally was supported by Microsoft, Wordperfect and some other industry heavies who released software for it. It had MIDI ports and became the industry standard for MIDI computing and is used in just about every studio. There is masses of good quality software for it - word processing, document processing, DTP, databases, Spreadsheets, art/graphics, music, programming languages, retouching software and much more as well as tons of games. The ST is now in it's twilight years although there are still a lot out there and new software is being released. The ST is well known and used in Europe where it has it's largest market share. Most shops and many mail order places sell hardware & software for it. You can add upto 12Mb RAM, hard disks, optical, flopticals, scanners, genlocks, TCP/IP networking, big screen monitors and hires 24bit graphics boards, samplers and whatever else you want. Earlier this year the Falcon was released which is a 68030 based machine with a DSP on board as well as a fully programmable graphics subsystem which can support upto 65000 colors on screen and goes upto some quite high reses depending on video bandwidth - I have had mine at 1400x600 - the monitor didn't like it though. It also has on board CD quality sampling and is now being reasonably well supported with digitisers, color scanners, graphics software and some awesome music software as well as a few games etc. It has not been the big hit everyone hoped for but is still selling well enough.
Now they have released the Jaguar which is a 64bit killer games system with superb specs (55 MIPS!) and is looking to give the Nintendo/Sega stranglehold a run for their money. 250 dollars for the console & 1 game. It has great hardware with several highy speed RISC chips and all the reviews so far have been good with many saying it beats the 3DO in game uqlity. It's early days though as it's only been ut a month or so.

|> I suppose they must have good graphics and sound for the games. Are they
|> good for anything else? They use 68000 chips. Are they compatible with

|> Macs?
You can get Mac emulators for the ST series and one is coming out aparantly for the Falcon that runs Mac stuff in color. The ST had good graphics in its day but is rather limited by todays standard. Ditto the sound.

|> There can't be much software for them. Do they run Unix? Maybe you could
|> compile the various freeware packages for them then, if they have a C com-
|> piler.
There are many good C compiler both commercial & PD. The majority of the GNU stuff has been ported and there are also various alternative OS's including Mirage, Minix and some others. Unix was released for the TT (a 68030 ST with enhancements) that was BSD with X but it was only mono, came pre-installed on a HD and was expensive. It's not sold now AFAIK. The current OS, MultiTOS is very Unix like internally and has pre-emptive multitasking, shared code segments, pipes and more.

|> What about parts, upgrades? Must be very hard to find. They don't even
|> sell Ataris around here. What do you do if your Atari needs service?
Add external floppies, flopticals, hard disks, scanners, digitisers, RAM upto 12Mb on an ST, 256MB on a TT, virtual RAM support, printers, anything really.

|> What do they sell for?
In the UK there are various ST packages with 1MB of RAM for 199GBP or 512K for about 140GBP. Falcons cost around 600GBP-800GBP and Jags 200GBP (250 dollars). Most add-ons are 3rd party.

|> Flames delightfully anticipated. Advocate your Atari, I'm listening.
In the US, the Atari market is all but gone. In Europe, particularly UK/Germany, it's still doing OK but not as well as it was. The Jag looks to have a great future and the Falcon may yet happen with the right software - Cubase Audio could certainly sell a few.

```

Hmm - I think you mean that your post wasn't anything to do with hacks in the Gx routines. In that case, sorry! It isn't particularly clear, though, it looks as though you're agreeing with the Gx comment.

The only thing I can think of that is a 'hack' and needs sorting out is the 'tfork' call (threaded fork). Forking on a 68k is tricky, because any addresses on the stack are absolute addresses. That means you can't just "copy all program space, instantiate new program, and jump to execute point", because things'll point back to the old program.

Minix gets round this by copying all the program space to the original location every time a contect witch happens. As you can imagine, this can be slow. HyC came up with an idea involving compiler support for this sort of thing, but that would need gcc to be modified. Anyway, tfork isn't that important - it will be sorted out soon enough for me.

[of course, on a 030+ this is taken care of much better]

Simon.

# 3694. ****ATARI JAGUAR'S FOR SALE****

>RH> Now, I don't think 55==128, is it?
>RH>
>The 128 MIPS figure is a guess, not a very good one either.

>MIPS = meaningless ... take this as an example:

>(Figures quoted from the Motorola DSP56001 handbook)

>The DSP56001 runs at 16MIPS, 96MOPS.

>You know the difference between MIPS and MOPS right? No? Ok...

Sure ... both numbers are used to impress the hell out of the user in
chapter one of these dsp books ...
Mips is almost no indication of speed, mops is even more fun because
they define a operation and then add all the numbers op again giving you
a neat and very unreal number.

for example im working on a multi-dsp system using the TMS320C40 core
(believe me it wins from the 56001 ;-) ) it tells you this in chapter
one :

CPU & DMA PERFORMANCE

CPU - 8 OPS/Cycle = 200 MOPS
* 2 Data Accesses = 60 MOPS
* 1 FP Mulu = 25 MOPS
* 2 Addr. Reg. mod= 60 MOPS
* 1 FP ALU Oper. = 25 MOPS
* 1 Loop Counter = 25 MOPS
* 1 Branch = 25 MOPS

DMA - 3 OPS/Cycle = 75 Mops

* 1 Data Access = 25 MOPS
* 1 Addr. Access = 25 MOPS
* 1 Transfer coun. = 25 MOPS
---
275 MOPS

DATA THROUGPUT

Global Port = 100 Mbytes/sec
Local Port = 100 Mbytes/sec
6 Com. ports = 120 Mbytes/sec
---
Total I/O = 320 Mbytes/sec.

Now produce me a peace of code longer then 20 lines that does something
usefull and uses all these modes ;-).
Second problem is that branch/intrups will happen and working around
these (using delayed jumps for example) is not that easy.

>On a normal processor (680x0 for example) one instruction usually means 1-2
>operations .. on a RISC (or DSP) that is not the case .. usually one
>instruction is between 4-6 operations ..

Im not sure if you look at all the modes possible on a 68020-68040 i can
think of a very high MOPS number compared to the MIPS number.

what about this : Move.l 8(a0)+,(8,a1) or Movem.l a0-a6/d0-d7,(a7)+ ?

see...

>So, when dealing with GOOD programming, you can easily go WAY above the "MIPS"
>figures.

It depends on your routines and how you made them.

>(And if the Falcon's DSP does 96 MOPS .. .ehrm ... I think you get it.)

In _NO_ way can you keep this rate up for more than 1 or 2 instructions
if this was the case they would make mips==mops ;-)

>Please get some information before posting.

Atleast its clear to me why you all believe the first specs of the jag,
its in the books so it _must_ be true right ?

>+ _______/ --------SiG(tm)------------ rickard_troedsson@troed.ct.se +
>+ _/roed ---- SysOp on Sarcastic Existence! - 16.8DS - +46-451-91002 +
>+-------------- Official RATSoft/ST and Climax SoftWare Support Site +

The SNES at the most today has a 20 mega-bit cart-> Street Fighter II Turbo.
The Genesis is 24 mega-bits-> Street Fighter Special Champion Edition.

The Jaguar early realeases is not even there... $COST$ ;-)

|> of these products.

Buddy, spare me your speech about ATARI, okay? I might even now more
about their things more than you. I was an ATARIAN way back since 1979.

The 'clone machine' they had-> ATARI never wanted to pop in a floppy
in their CES... Gee I wonder why.

About the CD-ROM, yes, looks like they had one. But my whole point
is that 'ATARI had many things ready' and NEVER released them.

Now, I believe they'll release the Jaguar CD-ROM, but as to WHEN,
$PRICE$, and 'developers developing on it' I reserve the right to
believe it when I see it.

|> I know someone who owns an Atari CD-ROM (CDAR504),
|> I have seen an Atari Transputer Workstation, and I know Atari has sold
|> several PC clones.

Not the ones they showed and promised so much at the CES though.
About the CD-ROM, I mean, the one you know, is it 'in house' ATARI developer
or what-> ATARI didn't release it, and that's my whole point.

|> The only thing I haven't heard of too much is the pen computer, and, IMHO,
|> Atari were right when they decided not to produce it (proof: Newton).

Proof: Newton? Did you know that the Newton has sold decently well?
Did you know Apple is in a $1 million contract (trial/validation) with
the Defense Department for medical/doctor apps? And if they want it,
it means $$$$ BIG MONEY$$$$$? Did you know that?

Well, that is definetely a laugh!! :-). I got my Jaguar in a few days ago and I agree with your friend except for the comment on the games not being good. Cybermorph is a very good game and the more you play it the better you like it. It is very complex and is a combination strategy and shoot-em-up game. Those who play it only 10 or so minutes and give up on it could come up with the conclusion that it is a so-so game. Cresent Galaxy on the other hand, is a so-so game as far as playability, but it has tremendous 24 bit grahpics. The screen are awesome. I wish somebody would have combined Cybermorph with CG, then we would have had an extremely playable game tremdous graphics.

Ken

AA> Actually they are. CD-32 has sold far more (than the Jag.) and the
AA> A1200 has sold far more than the Falcon.

Actually, I was talking financially... Atari stock rose from 1/2 to 14 in a few months and is not sitting at 6 1/8. All due to speculation on the Jag. I doubt the CD32 caused that much of a fuhror.

How long has the Jag been "officially out?" Less than a month. 55,000 machines sold in less than a month is pretty damn good. You will see that by the end of next year, the Jag will have sold much more than the CD32...

AA> > All you Amiga users go whine somewhere else.
AA>
AA> Yawn.

Oh that's right, the PC users got tired of your whining long before you came here.

You all claim about products not delivered by Atari. Well where's the protable Amiga, or the Emplant Falcon030 emulator?

JC> and they are NEW.

Ripped out of its content, sure.

All cartridge games are specifically written for the Jaguar - do you expect a
SNES game to work? (A500 games work on the CD32, that's why I'm bringing it up)

They are NEW, they have been written -93 or (soon) -94, whereas games for the
CD32 might've been written -86.

Easy.

JC> without these? Okay, Rickard, name me one game on CD32 that can fit on

is targeting their marketing at 10-17 year olds. A posting in another Atari
group says that Nintendo is a major competitor.
---

Just another Amiga looser, who can't distinguish game machines from
computers. Strike 1!

I suppose they must have good graphics and sound for the games. Are they
good for anything else? They use 68000 chips. Are they compatible with
Macs?
---

My Falcon has a 68030. The Jaguar has a bunch of other chips,
rendering it more powerful than anything you can dream of. Strike 2!

There can't be much software for them. Do they run Unix? Maybe you could
compile the various freeware packages for them then, if they have a C com-
piler.

What about parts, upgrades? Must be very hard to find. They don't even
sell Ataris around here. What do you do if your Atari needs service?
---

I run GnuEmacs and write POSIX compliant stuff using GnuC/C++.
Atari's do not break (:-)), so therefore there is no need for service.
Strike 3! Yourrrrrre Outr!

[Snicker, snicker. Ahem.]
---
[Mars, Mars. Ahem]

What do they sell for?
---
The cost depends on which model you want to buy. ;-)

Flames delightfully anticipated. Advocate your Atari, I'm listening.
---

You misunderstand - the Atari is perfection, you must attempt to
proove to me that whatever unworthy system you own (Amgia, Cray, SGI,
etc.) is even good enough to lick the soles of Atari's boots. So far
you have, of course, failed. Whatever machine you own is now rendered
irrelevant. Unless, of course, you own an Atari - but Atari owners do
not post the silly drivel you seem so fond of.

A 14 MEGABYTE PC/COMPUTER GAME IS ALREADY COMPRESSED (99% of the time)
---

I would doubt that the compression used would be as effective as JPEG
- take DOOM for instance, there is no way that the graphics are
compressed using JPEG - load time is too quick.

> The 'clone machine' they had-> ATARI never wanted to pop in a floppy
>in their CES... Gee I wonder why.

I am still wondering, WHAT PC clone was it they presented on WHAT CES?
I mean, they always had their clones on the Atari Messe and on the CeBit,
but obviously people were more interested in their 68k machines.

>|> I know someone who owns an Atari CD-ROM (CDAR504),
>|> I have seen an Atari Transputer Workstation, and I know Atari has sold
>|> several PC clones.
>
> Not the ones they showed and promised so much at the CES though.
>About the CD-ROM, I mean, the one you know, is it 'in house' ATARI developer
>or what-> ATARI didn't release it, and that's my whole point.

Atari obviously gave it to dealers, the guy I know bought it from a dealer
when they threw out all Atari hardware (they then concentrated on Apple
and PC and closed some months ago...).

>|> The only thing I haven't heard of too much is the pen computer, and, IMHO,
>|> Atari were right when they decided not to produce it (proof: Newton).

> Proof: Newton? Did you know that the Newton has sold decently well?
>Did you know Apple is in a $1 million contract (trial/validation) with
>the Defense Department for medical/doctor apps? And if they want it,
>it means $$$$ BIG MONEY$$$$$? Did you know that?

Do you know that the Newton is laughed at by major magazines all over the
world? Do you know that the Newton does NOT do what it is supposed to do,
i.e. reading written text in a fast and reliable way (a written 'Newton'
became 'Clinton' during tests etc.)? Do you know that from monday to
friday one can win a Newton over here, just watching ST:TNG and having
a Videotext capable TV set?
Now, that's NOT what I call a major success, but I am sure your opinion
is as valid as mine...

hmm the way that came out it sounds like the only thing up the CD32 has on the Jag is software and a CD, one of which will be out next year and the other of which is being contrinually added to. Operating system? what do you need it for (I don't mean that as a flame, I would really like to know)? To my knowledge (albeit a bit limited when it comes to gaming systyems and their operating systems), I did not think that SNES or SEGA had an OS.. or maybe they did...? Anyway I don't think atari wanted the Jag with an OS, they actually listed it as one of their positive points.

The Newton is just the first generation of technology. (I can't
belive this...I'm standing up for APPLE!) If Atari actually came out
with the STylus (or whatever they were going to call it) then maybe they
would have had a jump on the competition and maybe would have had better
tech by the time the competition came out with their pads. Oh well...
at least the Jag is a decent machine, and they should make a wad of cash
on it... (they got my $249 today).

Cybermorph is pretty good, but I don't like how the mountains
kind of pop out at you etc. Overall the graphics are VERY fluid... nice
shading too.

My only problem with my Jaguar is that after a few minutes of
playing the sound starts buzzing and screeching etc... the store told me
I could swap it with a new one once they get a new one in... Good system
though. Can't wait to see what they come up with... I mean... look what they
squeezed out of systems like the P.C. Engine and the original Amiga500s...
the Jag should be capable of some AMAZING stuff. Right now I just have to
wait for Alien vs. Predator and Kasumi Ninja.

BTW, is this some proprietary controller interface on the jag? Instead
of a standard DB9 it has an extra row of pins inbetween the top 5 and
bottom 4. I thought the Falcon and ST used standard DB9 ports??? People say
they have used Jag controllers in the Falcon and ST, but how would they fit
with the extra row of pins? All we need now is a joystick with 6 FIRE
buttons. And just what IS that hissing noise that comes out of the Jag?!

) This has been a very interesting Debate to observe. I'd like to
)get a new game system in the future and am leaning towards a Jaguar. I
)confess, I am an Atari fan, but I also confess that I'm leary about
)pumping more money into them. Their tale of video game screw ups begins
)before the Lynx. I have an unsupported Atari 7800 system which Atari
)doesn't even sell games for anymore. After watching them spend a paltry
)$300,000 advertising it, announcing vapour-games left right and centre,
)discontinuing their support magazine, scaring away third party developers
)and being rude to me, I'm really suspicious.

Well, they seem to really mean it this time - they've spent $4 Million
or so just in the test markets for advertising, and have $40 Million
lined up for national advertising next year.

)
) However, the Jag has gotten off to a good start, and Atari seems
)to have seriously looked at their past mistakes. I'm seeing more Jag ads
)in the test market phase then I ever saw for the 7800 and the promise of
)real developers is there.
)

I think the Jag has enough "real" developers now, that there should be
a number of good games to choose from later on.

) I'd like to know if the Jag third party developers have actually
)announced any games. A company can claim third party support, but if those
)developers don't make any games, a machine is screwed. Have any of these
)Thirty or so developers said what they're making for the JAG? If I see
)some good titles, I will be convinced.
)

Well, DOOM (a pc game) is going to be ported. Also a bunch of sports
games (not interesting to me), and Battlewheels (a great Car Wars like
game) is going to be ported too. Oh, also Beyond Zork for he Jag CD.
I think there are others, but that's all I can think of for now.

I'm not surprised it's all stuffed into 512k. After all, most
of the game consists of various polygon objects...those don't take up
too much memory since they're mostly math calculations. Plus, all
that Jaguar ultra compression stuff. I sure wish they built composite
output into the thing so I wouldn't have to wait for the damn cable...
but oh well. NICE system overall (even though mine is defective).

I hear that the Atari is fading in England too. Is that true? You cannot believe everything that you read.

The Jag controller uses the same interface as the STE/Falcon extended joystick
ports to the left of the machine (in front of the cart port) Most people
don't think about them since Atari never came out with anything to actually
USE those ports! :)

Well, after all it is a vector-graphics game. Those aren't really known
to use a lot of memory. Frontier for the Amiga is around 600K, for example.
When you start using bitmapped graphics and throw in some music (which is
absent from CM), things start to expand.

I don't know about plenty, but it's pretty normal at least.

>So what do you say Stefan, is the CD32 capable of a CyberMorph clone? :-D

I haven't seen CyberMorph in action, but I'd say it's capable of it,
albeit you'd probably notice more slowdown. I think `Inferno' by DiD is
similar to CyberMorph, and that should be released soon. We'll see then
how well the CD32 can handle 3D games. I don't expect any miracles though,
seeing as the CD32 doesn't have any fast-mem.

On the side of the Falcon and STE there are two additional analog 15pin
joystick ports .. those are the same as the Jaguar ones ..

(The reason the Falcon has seen very little games is because Atari FORCED all
developers to use those ports, and since the controllers haven't been available
... well .. I think you get it .. )

Jerky. Very. Nice game, shame the graphics couldn't have been a bit faster.
Now take DOOM (soon to be ported to the Jag) for example...

Shaun.

you're right about that. I just played DOOM on a 486DX2 66 and it was very
good. Actually it made me get a good case of motion sickness. Of course you
know the games are getting realistic when that happens. Of course when the
Jaguar picks this up you won't need to spend $4000-$5000 on a machine to run
doom, instead you can get a machine to play it on for a mere $250.. actually
very tempting considering many software packages alone sell for more than
that.. :)

|> came here.

|>
|> You all claim about products not delivered by Atari. Well where's the
|> protable Amiga, or the Emplant Falcon030 emulator?

Commodore NEVER announced either the Emplant Falcon030 emulator or
the portable Amiga. And I the Emplant Falcon030 emulator has never
been announced, to my knowledge.

ATARI, on the other hand, in the products I mentioned, they were
announced indeed.. Again, some people around here think I know nothing
about ATARI... how wrong. I hack the 8-bit ATARI *big* time. I submitted
to COMPUTE! magazine a multi-color character editor that was very cool
and powerful, enabling people to make redefined multicolor characters
for games and taking advantage of the extra color register (register 3)
wich was available on the bit where you join all the missiles into one

player-sprite (Compute! rejected the submission though).

No, I am not the guy who usually likes talking without knowing
what he is talking about (Rickard and Ham8 flames is a good example of this).
When I am corrected, I admit it and I give thanks (like I did to Chris recently).

So spare me the speech, ok?

Could be, I admit some games are like that. That's why I want
to play it, but so far the overall reaction to it (the majority) is
that it is bad.

|> It is very complex and is a
|> combination strategy and shoot-em-up game. Those who play it only

It lacks frames for the animation of the objects. I don't blame the
Jaguar, I know it can do better. ATARI has to come out with good
polished titles... I'm looking forward to Alien VS Predator.

Just wanted to add, little kid who thinks is in the 'know', that this proves that not all games 'are Amiga ports' AS YOU HAVE SAID.

Now shut up, and get more informed before you post.

And that doesn't guarantee that the games will truly either:

1. Take advantage of the Jaguar extensively

2. Even improve some of the graphics.

Proof? There are a couple of Electronics Arts games that are ported
from the Genesis to the S-NES without reworking the graphics.

Same from EGA PC games to Amiga (not anymore, thanks God).

|>

|>
|> I am still wondering, WHAT PC clone was it they presented on WHAT CES?
|> I mean, they always had their clones on the Atari Messe and on the CeBit,
|> but obviously people were more interested in their 68k machines.

The first time they showed them up.... and ATARI never wanted anybody
to try in a floppy. The clones were actually never released as ATARI
specified. ATARI stock went up at this announcement, and it went down
as a lot of p*ssed off stockholders didn't see the product materialize
later on.

Read the WalStreet Journal....

|>
|> >|> I know someone who owns an Atari CD-ROM (CDAR504),
|> >|> I have seen an Atari Transputer Workstation, and I know Atari has sold
|> >|> several PC clones.
|> >
|> > Not the ones they showed and promised so much at the CES though.
|> >About the CD-ROM, I mean, the one you know, is it 'in house' ATARI developer
|> >or what-> ATARI didn't release it, and that's my whole point.
|>
|> Atari obviously gave it to dealers, the guy I know bought it from a dealer
|> when they threw out all Atari hardware (they then concentrated on Apple
|> and PC and closed some months ago...).

AHa, yeah right. Is that why maybe you friend is the only one who has
it? I don't call a release of perhaps 100 CD-ROMS a release.

|>
|> >|> The only thing I haven't heard of too much is the pen computer, and, IMHO,

|> >it means $$$$ BIG MONEY$$$$$? Did you know that?
|>
|> Do you know that the Newton is laughed at by major magazines all over the
|> world?

BUT it HAS sold. Magazines can laugh all they want, or applying your
logic, don't you know how many magazines laugh or even ignore ATARI?

|> Do you know that the Newton does NOT do what it is supposed to do,
|> i.e. reading written text in a fast and reliable way (a written 'Newton'
|> became 'Clinton' during tests etc.)?

I have use one several times here, a friend of mine bought it. It's not
perfect, but it does a decent job. It also 'learns' your writting
with time. Did you know that?

|> Do you know that from monday to
|> friday one can win a Newton over here, just watching ST:TNG and having
|> a Videotext capable TV set?

So? That doesn't mean anything.

|> Now, that's NOT what I call a major success, but I am sure your opinion
|> is as valid as mine...

Bullshit. Have you actually USED a Newton?

What I told you about the military defense department is true,
if the Newton was so bad, why they would even consider it?

The Newton concept has been respected by major computing
publications, which applaud Apple for the effort (BYTE)

Magazines have laughed about many concepts before, which
they later on become a success (and viceversa). *TONS*
of magazines have laughed at ATARI around the world, yet
you advocate it. Something's wrong with your logic,
only you do self-deception.

All the existing Amigas can emulate the ST. None of the ATARI
computers can emulate an Amiga. How's that?

The Emplant-Falcon hasn't been announced, so it's a moot point anyway.

|> their operating systems), I did not think that SNES or SEGA had an OS.. or
|> maybe they did...? Anyway I don't think atari wanted the Jag with an OS,
|> they actually listed it as one of their positive points.

Having an OS is good and bad. It helps to make developers games faster
like say, role-playing type games. You don't have to reinvent the wheel
regarding managing icons on a screen, windows, objects, text, etc.

In other situations, it's good to have no OS (action games that require
precise control of everything).

CD-32 also has a good price. I think the important thing to remember
is that CD-32 can make very good action/role-playing games, the Jaguar
can make 3D stuff better.

So, it's not like the CD-32 can't do some type of games, but more
like the Jaguar can have another game-area which can be done better.

Considering the price of the CD-32 however, it becomes an advantage
of its own.

No flames, I like the Jaguar and the CD-32.

Which kind of points at why probably ATARI will not make
6 megabyte cartridges for a long time. If this little game
raised the cost of the Jaguar, imagine a ROM with 12 times more
capacity!

($100? $120?)

My problem with Cybermoprh is the fact that the horizon is so
close to the ship. HUUUUUGE mountains just pop right out of the screen
when you are 2 inches away from the thing (well not that close). I wish
they would have used some sort of mist or fog to hide this. Other than
that, it's a cool game... ESPECIALLY the gourad shading and the light
sourcing on the ship.

# 3741. ATARI JAGUAR Nice Review

Newsgroup: comp.sys.atari.advocacy
Date: 1993-12-19 22:52:16 UTC
From: ricardo@rchland.vnet.ibm.com
Message-ID: <1993Dec19.225216.1583@rchland.ibm.com>
Source record: 19572

Guys check rec.games.video.misc:

---------8x CUT HERE

Where: BUSOP.CIT.WAYNE.EDU, anonymous FTP. Directory (cd) PUB/PSELECT/JAGUAR.

What: Screenshots (admittedly low-rez) of Cybermorph; full multi-angle
shots of the Jaguar system, controller, and cartridge, as compared to
the Genesis and Super NES peripherals; Screenshots of the Jaguar opening
screens.

All in GIF format. Text files describe folder contents, nothing is
compressed in any way.

Why: To accompany my earlier post, the comprehensive Jaguar and Cybermorph
review, which will be available in the REVIEWS folder of the same site.

I can and will not send these files through mail, sorry.

Enjoy!

- Jer Horwitz

---

I just downloaded all that stuff and definitively
Jer Horwitz deserves a big standing ovation for a job
well done.

Check it out, Images and all!

Interesting, since I've seen Atari PC compatables for sale (besides Portfolio) There were 2 generations of them. THe first looked like the old megas, and the second were the "ABC" brand Machines. It's the second type that I've seen. They were in off-white cases that looked like ordinary PC cases. There was even a tower unit!

Yep .. I'm going for Llamazap for the Falcon, with a controller, and then I'll
get one controller with my Jaguar ... means I'll have two controllers for both
my systems .. (altough not at the same time .. ;)

## 3752. Reality, people...

Newsgroup: comp.sys.atari.advocacy
Date: 1993-12-20 13:14:44 UTC
From: laramary@eden.rutgers.edu
Message-ID: <Dec.20.08.14.44.1993.6072@eden.rutgers.edu>
Source record: 19580

God, so many posts, so few IQ points.

First of all, I'd like to say that I am an Atari user. I've always have
been, and always will be. I bought one of the first Atari 800's, and one of
the first ST's. I have yet to get a Falcon, because I really haven't any
money at all. Soon, though.

To my point- the bashing isn't neccesary. We are all very impressed with Amiga's, as well
as ST's. Personally, I think the 030 dusts the A4000 easily.
That's not to say that the A4000 sucks. It doesn't. If it did, most of us
really wouldn't put too much energy into flaming it. Really now, ever get
in to a fight with a TI 99/4A person back in 1984? No one cared, cause no
one was impressed.

The reality of the situation is this:

The Amiga gained the popularity the ST needed badly. Personally, I think
it's a more powerful machine, the ST that is. But the market held on to
the Amiga, and there wasn't enough room on the same shelf. The ST is still
around, but the support for it is light. I would rather look far and wide
to find that support, because I feel it is worth it by far.

If I had the money, I'd have an Amiga, too. Sure, I'd use it mostly for
games, but what's wrong with that? A nice Video Toaster w/A4000 would be
nice, also. But chances are, I'll get more quality work from my ST.

There's a lot to say. I guess this is very general. Maybe you have a
slight idea of how I feel. But if you still refer to Ami users as
"losers," then they will think of you as wildly immature. Me too, for
that matter, cause I am an Atari user.

Well, in terms of ST/TTs etc., it's definetly well over the peak of popularity
but they're still doing OK. It's more of a mail order market now as fewer shops
sell the stuff than used to although Atari UK did manage to sell a bunch of cheap
STFMs recently at a special price. STe's are still sold.

//// Bill Rehbock <CIS: 75300,1606> from Atari asks and answers
two
common questions:

• Q: How do I get specs on developing for the Jaguar?

A: People interested in Jaguar software development should send
a
fax to 1-408-745-2088. Include: Company name, mailing address,
phone number, fax number, and brief company/personal background

relating to software development. Due to the high volume of
inquires, we do prioritize the mailing of information kits
according to background (SNES/Genesis/Computer) titles that you
or
your company may have been involved with, etc. Companies
wishing to
become licencees may sign-on and order preliminary development
documentation and support for $299 USD, which can go toward the
complete development system fee of $7500 USD.

• Q: Can the Jaguar be networked to another computer?

A: Yes, it can, but there naturally would have to be
application-
specific software running on both the PC and Jaguar. The Jaguar
is
equipped with (among other interfaces) a one megabyte per
second
serial interface (suitable for connection to cable, telephone,
etc.) as well as a 9600 baud serial port that (with an
appropriate
low-cost interface) conforms to RS-232 standards. The 9600 baud
port as shipped on Jaguar is set up for ComLynx multi console
networking, just like the Atari Lynx.

Bill's been peppered with other questions, like one about how much
RAM comes with the CD-ROM add-on:

• There is no developer that won't always ask for more memory
or
more performance (on any system) :-)

The system has 2 megabytes of RAM in it so that the CD-ROM
drive
didn't have to have huge buffer space in it. Jaguar was
designed
with loads of flexibility, though, so if a developer wants to
have
extra ram in a cartridge, they _could_ do it if they wanted to.
The
cartridge port is accessible even while using the CD-ROM drive.

One other point that I wanted to make was the fact that
although
there is no built-in operating system, we do supply to
developers
various sets of libraries to do the things that need to get
done.
Such as: a multi-channel polyphonic FM/Wavetable synth; JPEG
decompression; video set up; drawing primitives; 3D rendering
with
gourad shading/texture mapping and camera manipulation; and

others.
Many of these come with complete source code so that they can
be
optimized for the specific use that the programmer is using in
his/her game. It's much more flexible and obviously a
performance-oriented way of doing things.

Next, Bill drops some performance data on AvP and DOOM:

• Jez San has only seen a very early version of Alien versus
Predator which was a very slow (for Jaguar) 12 to 18 frames per
second. It now runs (when you are playing the game as an Alien
:-)
at a full 30 frames per second. I promise that no one will be
dissappointed with DOOM or AvP on Jaguar.

The first time I saw DOOM, I said, "I've got to have it on
Jaguar,"
and I proceeded to track down Jay Wilbur and the guys at id. I
flew
down to their office the day before I had to leave for our New
York
roll-out party to meet with id. I THEN got to see a real
version
and I was really blown away :-) It is an absolutely awsome game
and
I look forward to seeing it released during 1994.

//// Don Thomas <CIS: 75300,1267> has taken a lot of time to
respond
to questions. First, here is an overall impression of Jaguar:

• I think the first few games (Raiden, Dino Dudes, Cybermorph
and
Crescent Galaxy) are pretty hot... they'd certainly be shining
stars on any lesser system assuming they could handle them. In
my
position at the office, I already witnessed fragments of what
are
on some of the forthcoming products. I hear the hallway chatter
of
engineers. I see unfinished graphics on souped-up power
computers.
I feel the thunder from 3-dimensional music compositions. I can
tell you, that as hot as the first games are... YOU WILL laugh
at
them in even a year or less.

Keep in mind that the Jaguar has integrated secrets which lie
deeper than an impressive game macine. With expansion
capabilities
that include ComLynx and telephone, peripheral components such

as
the CD and VR appliances, connectability to full motion video
and a
variety of AV standards, the roar of the feline is none less
than a
preemptive purr.

At the risk of sounding overly dramatic, you ain't seen nothing
yet!

# 3758. Jaguar Info part 2 (long post)

Newsgroup: comp.sys.atari.advocacy
Date: 1993-12-20 19:43:59 UTC
From: jagman@lakes.trenton.sc.us
Message-ID: <1NgVec4w165w@lakes.trenton.sc.us>
Source record: 19489

Here is part two of Jag info.

Next, when asked about the Jaguar showing up in mass market outlets:

&#65533; Mass merchants... will often delay taking on cutting edge entertainment products for several reasons. One is that they demand siginicant quantities while the dedicated electronics chains are better equipped to deal with preorders. The dedicated electronics places are better at providing informed personnel to sell new items.

It is common for explosive new electroinics items to prove themselves in specialty stores before the mass merchants take them on. In short... keep an eye out. You will definitely see expanded distribution as time wears on.

And here's what Don had to say about the bad batch of RF switchboxes:

&#65533; Atari has always planned to pack a reasonably nice RF box in the Jaguar systems. As we saw ourselves pressed against deadlines to meet Christmas '93 orders, we found that we could not take delivery on the originally planned ones in time, so we accepted a lesser quality, manual switch which we were told by the factory would work fine.

For the record, there is nothing really terribly wrong with manual switch. Any real problems people experience is largely based on the specific AV setups people have. With today's technology, people have many more things connected to their TV's than they did 10 to 25 years ago, so there's a much greater chance for interference.

As soon as we heard that some people were having unusually high interference on the manual switch, Atari pressed to speed up the availability of the better automatic switch. Still not having access to the first one planned, Atari ordered a temporary supply to tide us over from Radio Shack (Archer brand).

I look at it like this... Atari packed some of the original Jaguars with factory tires. Most people know that RF connections are not as good as S-Video or composite connections and there is no perfection in an RF connection, still the Archer box is successful at screening out the majority of any interference that the other box seemed to let through.

If anyone received the manual switch box and cares to send it to us, we'll swap it out. We'll need a serial number and other information.

In regard to the other cables, I expect them real soon after January 1.

Don tells how Atari processed the direct Jaguar orders:

> • I kept a growing list of prepaid orders whereby I was eventually told I could accept no more "guaranteed" by Christmas delivery dates. Unfortunatley the list grew too fast and we had to cut off the number we were selling direct with guarantees that deliveries would be by Christmas. At that point, the calls still kept coming in and we were unclear for a week or so whether just because we couldn't "guarantee" delivery by Christmas whether that meant we absolutely couldn't deliver by Christmas. As a result, I instructed my staff to tell everyone that we would do what we could.

That cut off time to my staff was very clear. We processed credit cards before that date so we knew there'd be no credit hassles as soon as the product arrived. All those customers were told that their orders had to be prepaid for that reason. After that, we stopped processing credit cards for the specific reason that we were unsure that we could deliver as hoped. My staff was

instructed
to only say we would try and do our best since everyone wanted
delivery by Christmas if possible.

I am really sorry if there were any misunderstandings with your
requests. If your credit card was not charged but there were
hopes
to ship in time, it is because we were in the "we hope we can"
mode
and before the "we know we can't mode". At this time we are
sold
out before year's end and if you weren't charged it is because
I am
unable to ship.

We have a ton of what we call "pending orders". We are waiting
word
daily to see when we will get more units so we can call those
customers, confirm the orders and follow-up accordingly.

You might also wish to contact some of the chain stores and see
if
there's something they can do for you. We had several
cancellations
throughout all of this (they were immediately filled with the
next
in line) because consumers found stores to ship them a unit
before
we could. If you find one, just tell us you did so when we call
to
confirm your order.

Don gives a disappointing answer when asked about direct orders
from
overseas:

• I am not allowed to take orders from patrons outside of U.S.
or
Canada. There are several reasons for this, most boiling down
to
our COMPLETE inability to properly service any problems. There
are
other Atari subs that are responsible for sales in other
countries.

Having said that, some people make arrangements to have a
friend in
the U.S. do the purchasing and forward the item when received.

Keep in mind that there may be physical differences. I know
there
are differences in the carts for PAL countries for instance.

Atari
U.S. does not have those delivered to Sunnyvale.

Someone posted a negative message about the legal notices on
Jaguar
boxes prohibiting rental usage of purchased Jaguars. Don gave his
opinion:

> I cannot speak officially on behalf of Atari simply because I
am
not physcially a part of the decision making or implementation
of
the rental aspects of the Jaguar. So my comments are unofficial
and
they are subject to correction by more informed people...

As I understand it, special license and arrangements will be
required by those interested in purchasing the Jaguar and
related
products for rental. Atari has already designed special rental
hard
shell cases (I'm hoping I can get them for resale---they're
real
cool!). I do not know if there are any physical differences in
units intended for resale, but I am definitely under the
impression
that we have every intention of catering to the rental market.
To
protect our rights, we are labeling the packages against
rentals so
we can address those needs independently on equitable terms.

When you look at some of the peripheral things we do to protect
our
interests and make an extra buck, remember back to when people
were
asking how we planned to put out a 64-bit system for less than
$250. Atari has always been pretty good keeping prices as low
as
possible, but we also want to make money. To do that, we will
certainly want to sell and license our merchandise; not give it
away.

//// Mike Fulton, <CIS: 75300,1141> had this to say about the
internal
working of the Jaguar:

> The Jaguar has 64-bit registers in the TOM chip, the data is
worked on internally 64 bits at a time, and the system has a
64-bit
data bus. It is true that there are some registers which are
32

bits, but the system as a whole is a 64-bit machine.

To go back to the car engine metaphor for a moment, if you had a
car with four engines, and one was a 4-cylinder, one was 6
cylinders, one was 8 cylinders, and one was a 12-cylinder, which
would you refer to when you were talking about the car's
horsepower? (To be perfectly honest, I don't think the car
metaphor works real well, but I think you get my meaning.)

# 3759. Jaguar Info part 3 (and last) (long post)

Newsgroup: comp.sys.atari.advocacy
Date: 1993-12-20 19:46:18 UTC
From: jagman@lakes.trenton.sc.us
Message-ID: <VRgVec5w165w@lakes.trenton.sc.us>
Source record: 19490

Finally, part three of Jag info.

John Mathieson <CIS: 100111,2631> - one of the designers of the Jaguar - speaks with authority on Jaguar hardware:

> From my limited understanding of the 3D0 hardware, I believe that Jaguar out-performs it by a factor of two, broadly speaking. Of course, both systems have their strengths and weaknesses, but I believe Jaguar is much better suited to 3D animation compared to 3D0. Also, we (Atari) publish the full hardware specification (to signed-up developers), whereas 3DO force you through an OS. Games programmers tend to want direct access to the hardware and full control of the system.

Jaguar can produce an interlaced display with 720 pixels across readily. In fact, the maximum resolution horizontally is around 1350 pixels, although you have to do some tricks to have more than 720 pixels horizontally.

> As one of the Jaguar designers, I thought you might like to know why there is a 68K in Jaguar. (I did the GPU & DSP, and the blitter). In one of our cost reduction drives, we seriously considered no CPU, however I vigorously opposed this as the GPU and DSP are unfamiliar to programmers, were never meant for overall system control, and are only really fast out of their relatively small internal RAM blocks. The principle is that you get your RISC processor to do all the intensive but fairly simple low level parts of a 3D game, and you get a CISC processor to handle the high level, complex, but fairly un-intensive parts - e.g. game-play, view point control, collision detection, etc. Those complex addressing modes are great for rattling round structures. Its also important to have a manager in a multi-processor system, and the 68K performs this task well.

Because the GPU and the DSP both out-perform the 68K so
significantly, I joked that the 68K was "only there to read the
joysticks". This joke seems to have spread a little far, so
lets
kill it now.

• The answer to Jaguar's bus width is that it is 64 bits where
it
needs to be. The two highest data rate paths, which are those
between the RAM and the object processor (display generator),
and
that between the blitter and RAM, are truly 64 bits. The
blitter
can generate Gouraud shaded pixels as fast as the DRAM can run
in
page mode (13 MHz for us), so it can do 52 Mpixels per second
in
Gouraud shaded 16 bit pixel mode. The display generator can
load
pixels into its internal buffers as fast as the RAM can supply
it.

The RISC processors manipulate 32 bit data as this is all the
precision they need. They have 32 bit ALUs and 32 bit address
generators. They can perform 64 bit transfers on the main bus
if
they need to, but not many data are this big. The graphics
processor uses the blitter as a co-processor when it really
needs
to blast pixels. The instruction size is 16 bits as this allows
a
reasonable number of instructions plus two register/data fields
in
each instruction.

The name of the game is bus saturation, if you can keep a 64
bit
bus fully utilised, then your processing elements are as fast
as
they need to be. Well written Jaguar code can get close to this
-
you ain't seen nothing yet.

By the way, the first time I saw Alien Versus Predator I did
not
believe Jaguar could do that. I look forward to many similar
surprises.

//// Jez San, the author of the ST classic Starglider, and
currently
with Argonaut Software <CIS: 72247,3661>, is one of the newest
Jaguar

developers. Here's what he's had to say about Atari's latest cat.

• All this is leading to the question: Is the Jaguar a 64 bit machine?

It is. No question about it. It has several parts that are 64 bits
big and it has a 64 bit memory architecture, so it is a 64 bit
system. Its also a pretty nifty system... I think its a very
copmetitive system, and the power of the hardware is not even
touched by the present batch of the first games.

I feel that Atari are justified in calling their machine a 64 bit
machine regardless of how many bits their cpu contains, since it is
the overall system which is talked about, and not simply the
cpus.

Case in point, the TurboGrafx 16 is known as a 16 bit system, even
though it has an 8 bit processor. Thats because the rest of the
system is 16 bits and the aura that the meachine projects, by
virtue of its superior graphics to 8 bit systems deemed that it
should be called a 16 bit system.

=-=-=-=-=-=-=-=-=-=-=-=-=-=
//// Jaguar advertisements
=-=-=-=-=-=-=-=-=-=-=-=-=-=

There's been almost a half-dozen Atari Jaguar television advertisements
shown over the last six weeks in the test markets here in America.
Doug Engel <GEnie: D.ENGEL>, or "Thunderbird" as we know him on GEnie,
transcribed one of the latest Jaguar and the following Lynx ads:

Fade in

Announcer: "Here's Benjamin Hall on the Jaguar system to play
Cybermorph."

(Kid holding cart plugs into close-up of console)

Announcer: "Let's see how those beastly graphics and intricate moves
that ONLY come from 64 bits of mega-power feel!"

(Various screenshots inter-cut with wildly tilting camera clips of
Benjamin Hall ducking and weaving in his chair as he plays)

Note: screenshots are moving at breakneck speeds and show the system
off better than the previous commercials.

Announcer: "Ben?"

Benjamin: "Urrrllllphhh!"

(Head and shoulders frontal shot of Ben looking ill, as he projectile
vomits _into_ the camera lens! Yellow and brownish bile and food chunks run down the lens.)

Announcer: "Cybermorph only on Jaguar by Atari"

(Screen shows Cybermorph into screen complete with "Designed By ATD",
and "(C) 1993 Atari")

Announcer: "Get bit by Jaguar!"

(White Jaguar Logo appears, with the clawmarks of the "R" scratching
down with a shredding sound effect and a Jaguar roar as blood floods
down from the top of the logo turning it red. A small white Atari fuji
and logo appear on the bottom of the screen with a yellow "64-Bit"
under that with the yellow eyes appearing on top of the logo.)

Fade out:

And the Lynx commercial.

Fade in:

(Boxing ring bell sounds as two fighters appear in a close up of the
Lynx screen with the words "Lynx" and the Atari logo clearly visible.
One fighter knocks the other one down with a kick, and turns to face
out of the screen. Lynx screen shows close-up of his face)

Fighter: (Yelling) "I like Lynx, the screen is bigger."

(Lynx switches to baseball game viewed from behind the pitcher's mound where the pitcher has a Fuji logo instead of a number on his uniform. Crowd is cheering in background. Pitcher pauses before winding up, turns to face the camera, and smiles.

Pitcher: "I like Lynx, more can play at the same time."

(Screen changes to show Count Dracula's head on the right side, and
three scantily clad women [complete with gratuitous cleavage] on the
left side. Howling in background, as Dracula peers around suspiciously with his beady eyes.)

Dracula: "Lynx has 16 bytes, I mean BITS."

(Light glints off Dracula's fang as the entire screen switches to a close-up of a GameBoy [without any logos on it] Onscreen a horribly low-rez smiling face appears in dark creamed spinach color on a light creamed spinach color background. The face is standing on a single horizontal line and has arms and legs. It moves its hands in a waving motion, but othewise is static except for mouth movement and blinking eyes. A cartoon-like "boing" sound is repeating in the background.)

(Nintendo and GameBoy copyright appears in white on screen bottom)

Smiley Face (in nerd voice): "I like... Game Boy."

Announcer: "3 out of 4 characters prefer Lynx. Buy Lynx now, get NFL game free!"

(NFL Football box spins out of Lynx and stops in full view)

(Fine print appears at bottom of screen telling how NFL tradmark is licensed and how the offer expires on SuperBowl Sunday 1/30/94, and you pay $3.50 p&h, etc.)

Fade out!

Of course he paid $249. That price is pretty much fixed. (Well, that is suggested retail, and what the stores around here ask).

You can also order direct from Atari for $249.

(I.E. I would not pay some guy $300 for one. They are in limited supply right now, but you should be able to get one within one to two weeks without a problem).

So should us other people who can get Jags try to undersell this guy?!?!? I would charge $249 (ratail) + Tax (about $18) + Shipping ($7) + Fee ($10).. Thats, let see, carry the one, $284...

So $300 is not outrageous. Then again the seller probably wants you to pay shipping as well, so . . .

Just my opinion. (I.E. I do not like to see people try to charge people a bunch for simple things (especially when of questionably legality, as I am sure he does not possess a retail liscense??)) (e.g. I once copied some live music for about 20 people on the net for no profit (just cost of the tape and shipping) (I actually lost just a few dollars in round off errors and so on) ).

Thats how I see it. However, $300 is not outrageous if that includes shipping and tax and all. So if you really want one, and you trust this person with your $300, go for it.

Well stated, more or less....

There is really no way this Amiga vs. Atari war will ever end, or even really be "elevated" to a high IQ level. As others have said, it is sort of a holy war. At least this stuff does not end up on comp.sys.atari.st and comp.sys.amiga anymore.

But I applaud your message. Every now and then, some meaningful insights can be gained from rational debate.....

## 3763. Availability of Jaguar in Australia

Newsgroup: comp.sys.atari.advocacy
Date: 1993-12-21 04:40:20 UTC
From: hutch@tartarus.uwa.edu.au
Message-ID: <2f5unk$ju9@uniwa.uwa.edu.au>
Source record: 19491

I was wondering if anyone knows whether the Jaguar has
been sighted in Australia, or when it will be released
here. This machine looks really tasty and I want one
quite badly.

Also, in Australia we use PAL. I hope the PAL Jaguar
does some tricks to ensure all games are fullscreen,
unlike Amiga which cuts off the bottom 1/3 of the screen
when you play an NTSC game in PAL mode.

- Jas! ;-)

:#|> kilobytes!

:# Which kind of points at why probably ATARI will not make
:#6 megabyte cartridges for a long time. If this little game
:#raised the cost of the Jaguar, imagine a ROM with 12 times more
:#capacity!
:# ($100? $120?)

I guess that's why Neo-Geo catridges cost so much. I'd never really thought about the cost other than it was expensive and that it must have been due to the awesome games but if you factor in the cost of ROMs then the prohibitive cost of Neo-Geo catridges is understood. I wonder how expensive these 50 Mbit games will be when they come out for the Jaguar catridge.

:#JC> JC> So, I wonder how many catridge based Jaguar games will be ported to
:#JC> CD.
:#JC> JC> Same thing applies.
:#JC>
:#JC> Definitely not! All cartridge games are SPECIFICALLY written FOR THE
:#JC> JAGUAR,
:#JC> and they are NEW.
:#Ripped out of its content, sure.

No. Unless you want me to post the whole message. The only things deleted
was parts before and after that do not pertain to that part of the posting.
Everthing else deleted was your responses to my posting. I posted the
significant part and then you claimed it was ripped out of its context I
suppose you mean, and not content.

Rickard, you claimed I lied, I gave proof that you asked for and then you
do nothing to apologize for your rude remark. Everything I've been talking
about has been based upon your postings, again tell me where I've lied. If
I haven't been lying then I guess you must be the liar.

:#All cartridge games are specifically written for the Jaguar - do you expect a
:#SNES game to work? (A500 games work on the CD32, that's why I'm bringing it up)
:#They are NEW, they have been written -93 or (soon) -94, whereas games for the
:#CD32 might've been written -86.
:#Easy.

Oh, now you're trying to weasel out of your past postings. In no way was
your posting claiming there was anything specific as to dates. I gave my
basis for the definition of ports and now you're claiming something else
with no proper definition. Make up your mind either Jaguar games will be
TOTALLY NEW or they'll have some ports.

Also, you're now claiming games for the CD32 to have games from from 1986,
I hate to tell you but, this shows your ignorance or your fumbling for
anything to help your failing creditability. Most games written for 1986
Amigas, will most likely not run on the CD32 unless re-worked. Now, your
claim that anything written in '93 or '94 is NEW, then I guess we can say
most of the games are new and ported on CD32 since most of those games came
out in '93.

:#JC> without these? Okay, Rickard, name me one game on CD32 that can fit on
:#JC> 3-4
:#JC> disks as you like to say. You must have some proof to your claims, right?
:#Ouch, I think you went too far here .. I won't START listing them, don't wanna

:#embarass you.

I posted proof of your past idiocy. Given your losing creditability, I guess we can say you don't have any proof, and are just lying again. Btw, I didn't say make a list, I said one game. You mean you can't even give me the name of ONE game? Rickard, if you can't or are not willing to state proof I recommend that you should keep quiet about things you cannot prove.

:#JC> Software, CD drive, software, keyboard, software, drives, software, HD,
:#JC> software, developer support, software, an operating system, software...etc.
:#LAUGHTER
:#So had my SNES, I sold it anyway.

Well, seeing as the SNES doesn't have a CD drive, keyboard, etc., I guess that's why...8-). I really don't care if you sold your SNES, it has software which is currently helping it to survive and even make a large profit. Until the Jaguar has a larger software base and more things, I wouldn't call it a success as yet.

Btw, I have a Genesis that I still plan on keeping because it has lots of software, some good and some bad but til I finish playing it to its maximum or it breaks it is serving its purpose. Same as other people who are still playing on their 8-bit Nintendos or Sega systems. Without software what good is the machine, for decoration?

:#RH> Now shut up, and get more informed before you post.

:#Now where the hell have I said that all CD32 games will be AMIGA ports?????
:#(I've stated in rec.games.video.misc that I think the CD32 will see many
:#Megadrive/Genesis and SNES ports)

Your definition of ports is getting a bit strained here. I thought you
said any game form '93 is NEW and not ports. Also, considering your past
statements, about games being ported to the Jaguar having to be
'rewritten', I don't see how you can run Genesis and SNES games on the CD32
without being 'rewritten'. Of course considering the Jaguar has a 68000
processor, I guess the same is true for the CD32 as for the Jaguar. Like
Stefan said, it wouldn't be hard to just move games from one platform that
contains a 68000 to another that has a 68000.

Btw Rickard, you said most CD32 games will be AMIGA ports.

:#Telling lies from truth comes when you mature ... I'm waiting Raist ..

Rickard, your creditability is failing. At least Richardo provides proof,
all you seem to do is claim something and when comes time to provide proof,
you either claim you said something else or say it isn't worth your time.

>Amiga then drift towards the ST.

Mostly they come out on the Amiga full-stop.

Very few software houses make ST games any more - there is only a
port if the Amiga version isn`t too heavily dependant on the Amiga
Hardware and thus they can easily be transferred to ST without much
additional cost.

>:#The Jaguar on the other hand will get less of the computer ports, and
>:#more console type software with good playability. Cybermorph sounds
>:#good, and I'm also eagerly awaiting Raiden (I play this a lot in the
>:#arcades).

Since the Jaguar is so radically different, a software house will
need to be really committed to produce a game for it. Most likely,
if any games are produced they will simply be ports of Sega/Amiga/PC
games .. I can`t see anyone risking money on making a completely
new game for Jaguar only - apart from a few dedicated development
houses.

>Considering the CD32 hasn't been released for America is no surprise that
>the level of support (developers) is lower than the Jaguar. Though the
>level of support worldwide for the CD32 in comparison to the level of
>support for the Jaguar is overwhelming.

Theres LOTS of support for the CD32 in Europe. I`ve seen upwards
of 15 different games for it in local shops - with about 40 `new`
CD32 games currently available (and about the same number of CDTV
titles which run on the CD32).

In comparison, there will only be 5 titles available for the Jaguar
within a few months of it`s release. If Atari don`t pull there socks
up this will most likely lead to another of their famous flops.

Yes, this is the problem with the Falcon. It has a nice DSP with
potential for doing things like texture mapping, bitmap rotation
etc, but noone makes any software (like games) which take advantage
of it. It`s therefore seen to be pretty irrelevent when deciding
which machine to buy - and the cost of including it in the hardware
pushes the Falcons price into the unaffordable zone.

Take note Atari -> No software = No sales.

>Stupid! No one has ever asserted such thing, nore is anything of the above
>reasonable.

No, the basis of the thread was that CD32 games won`t take
advantage of the hardware since they will just be straight Amiga
ports and that since the Jaguar is totally new then all Jaguar games
would be specially designed for the Jaguar.

This is quite obviously rubbish. Most games for the Jaguar will
be ports of existing games. What you will end up with is (at best) a
perfect copy of the Sega/Amiga etc. original. Theres nothing wrong
with this, but they certainly won`t herald a new age in videogaming
like many Atari fans seem to think. At least the CD32 has an
advantage here in that it can run the original Amiga code and so,
much much more stuff will be ported to CD32 than you`ll ever see on
the Jaguar

>RH> |> The JagCD has been ready for months.
>RH>
>RH> Aha, yep. Proof?

>GamePro October. Kinda difficult to show a production unit if it's not ready.

Ever heard of mock-ups? If its ready, where is it? How many games
have been coded for it? Come to think of it, why is the Jaguar so
rare anyway? many dumb Atari-losers like yourself were saying the
Jaguar would be out in numbers for Xmas - I haven`t seen it anywhere
in the shops or mail order mags.

What a cock up! A machine like the Jaguar NEEDS a CDROM drive,
yet Atari are making the base model a cart-based machine. I saw an
interview with the company doing `Aliens vs Predator` and they were
complaining that it was difficult to make much use of 16/24 bit
bitmaps and 16 bit sound fx when you are limited to a 2 megabyte
cart.

>RH> Well, then the A4000 killed the Falcon? What's the difference?

>I would like to see some sales-figures on the A4000/040 before answering that
>one.

No, the A1200 killed the Falcon (stone dead). Oh, it had a
little help from Ataris inept `non - marketting` too of course.
There are probably more A4000/040s than F030s, but not many. This is
irrelevent tho`, since they can play all A1200 software (and most
standard 16-bit ECS stuff too) and OS-legal
stuff can benefit from the faster CPU and better resolutions.

>I bought a console when I wanted to play games, I still think that's the way to
go.

Its the way to go if you own an Atari. Personally, I enjoy playing
great games like Frontier, Hired Guns and Mortal Kombat on my Amiga.
I`d hate to have spent dosh on a Falcon only to find that there was
little or no entertainment software for it.

Exactly. There has been plenty of time for DSP software, the
reason why there is so little is because of the Falcons failure to
sell. It`s just not worth anyones time to waste effort developing
specialized software for such a small user base

>That's exactly what I want - more levels, better graphics and sound.
>I'll get some of that with the increased cart size of the Jaguar,

Look, the Jaguar does NOT have an increased cart size. It is
subject to the same limitiations as the other consoles - ROM chips
cost money. The bigger the cart, the more expensive it will be. You
could have a 10 megabyte cart on any system, but the prohibitive
cost would prevent the game selling. Given that the 16 bit sound
and 24-bit gfx are a big selling point of the Jaguar, then having to
fit games into 2 megabytes will be a serious limitation. Even some
megadrive and SNES games are offering 24 `meg` (3 megabyte) carts now,
so how do Jaguar developers expect to keep their code within 2
megabytes? Compression will help, but then any system can compress
the gfx and sound so the jaguar isnt unique there.

>I myself will be a Jag owner (soon, I hope - damn those fools at FAO Sw.!!)

Ahhh, I remember the talk from advocates in this group a couple
of months ago saying how the Jag would be out at the end of october.
Its nearly Xmas and still no-one has one.
Jag-CD ready now??? Ho ho. give me a break!

>Amiga even had better games than the 'game consoles', I was just
>referring to the fact that SOME computer games in ALL platforms
>are bad.

Right on! Look at some 16-bit ECS Amiga software like Hired Guns,
or Frontier, or Desert Strike, or Mortal Kombat, or Cannon Fodder,
or The Settlers, or StarDust, or Alien Breed `92 ... and many more...

Tell me that these games are crap because they are available on a
computer format. Few of these even push the 16-bit Amiga, I`ve seen
nothing yet that even comes close to fully exploiting the 32-bit AGA
Amiga (there are still some excellent AGA games though!) and few
games even scratch the surface of the CD32s capabilities yet.

Trying to hype the Jaguar on the basis of its specs is useless.
It will be a long time (if ever) before it has anything CLOSE to the
range and quality of normal 16-bit ECS Amiga software, and with
32-bit AGA software constantly improving and more companies using
the CD32s storage abilities property, I think its pretty obvious
that the CD32 scores heavily on the SOFTWARE side of things.....

BTW. The A1200 can easily outperform the SNES. Even the 16 bit
Amigas were better in very many ways. The only thing the SNES has
going for it is the screen rotation type effects which are overused
and generally inappropriate to the games.

KG>and
KG>|> also another worrysome thing to me is that CD-32 games have different
KG>|> versions of PAL and NTSC games - this could leave American purchasers
KG>|> out in the cold for many releases.

But ALL systems have this problem. European Jaguar users will
find that they have to put up with a letterbox picture and slower
action than the games were designed for. At leat with the AGA
chipset, you can run the games in PAL or NTSC as you choose,
assuming your monitor or TV can support it. Is there anyway of
choosing PAL/NTSC output from the jaguar????

>|> ) Take Turrican: put that on CD-32, add a CD-quality soundtrack and
>|> )that's it. It is a very good action game. Maybe do cinematic sequences,
>|> )but what else you want?

I think many games could benefit from video spooled from CD at
strategic points...

eg You blow up the enemy base/mothership and you see a full motion
video animation of it being annihilated,
or you get people talking to you in FMV windows giving you mission
objectives,
or you spool background gfx for racing games of of CD,
or you store lots of sound samples and bits of speech for use in the
games,
you have lots of pictures for graphics adventures,
or you have lots of ham8 presentation screeens.....

Theres so much that proper use of CD storage can do for games, in
both presentation and gameplay.

Not to mention the fact that they are MUCH cheaper than carts to
produce. Even if you just use the CD on the CD32 to shove a game
into the 2 megs or RAM, then you have the equivelent of a SNES or
Sega `16 meg` cartridge, at a fraction of the price that
manufacturing a ROM costs.

There are many Falcon apps that use the DSP. Apart from all the music progs, many art packages use it for effects. The JPEG load modules in most packages tend to use it. Chroma Studio 24 uses it for most of it's graphics transformation functions. A lot of PD stuff uses it as well. Just because you haven't seen the software, it doesn't mean it doesn't exist.

Assuming you mean TOS, a preliminary version was based on CP/M but the version that the ST was released with was a whole new OS. This is an urban myth. If you are talking about MultiTOS. can you be more specific? It runs fine for me. Last night I was unpacking 3 different lzh files whilst logging on to my local BBS. I also had lattice C up and running at the time. Sure, some stuff doesn't like MultiTOS if it's badly writtewn but usually you can configure MTOS to handle it with entries in your MiNT.cnf & GEM.cnf files to control memory per process etc. The current AES is slow (bloody slow) but a new version is on the way that is a lot faster - I am told this by developer who has it.

Haven`t you got it yet, Rickard?

The Falcon has little games because it has sold so poorly. Part
of the reason for it selling so poorly is that it has little games.
I don`t think the choice of Joystick ports is going to influence how
much games software becomes available for a system somehow. Dream on
though, maybe someday you`ll wake up back in the REAL world.

>will run on it ie just about any standard GEM package and many games.

Sorry, but thats not an awful lot of software and hardware. There
are about 10 different accelerator cards for the A1200, dozens of
ram/fpu expansions, 50+ games (and all OS legal software which is of
a far greater range and quantity than that available for the ST)
that benefit appreciably from the AGA chipset and faster processors
of the A1200 and A4000. Add to this the ability to run the vast
majority of normal (16-bit) software which the Falcon lacks (It
seems to be completely incompatible with all non OS-legal ST
software) and you start to see what a poor choice the Falcon owner
has compared with the A1200 owner.

Why would an ST owner choose a Falcon when nearly all of his
games would stop working and there is such a limited range of stuff
available? It would make more sense to pop an accelerator card into
the ST.

BTW How is lattice C Falcon specific? Don`t you just mean
that it will compile things faster?

>lot faster - I am told this by developer who has it.

Are you sure TOS was a completely new OS? I remember reading the
Atari mags at the time and they said that TOS was licensed from
Digital Research (who programmed the GUI GEM as well) and that it
was a modified version of the CP/M-68K system.

Anyway, TOS was designed as a single tasking, single user OS and
didn`t have much in the way of features. Atari users were always
slagging off the Amiga OS and saying how useless multitasking was.

Now of course we have an official multitasking version of TOS,
but the problem is that TOS was never suppposed to be multitasking
in the first place, so the resulting system suffers from memory
inneficiency, lack of speed and incompatibility with a lot of older
software, even stuff that was supposedly os-legal.

It strikes me as a bit like DesqView on the PC, you do get
multitasking but with a fair degree of inneficiency and quite a few
problems with certain software.

Since the Amiga always had multitasking, the OS has been able to
evolve into a much more efficient system, rather than having things
hacked on.

Atari pretty much decided to drop the ST hardware when they made
the Falcon, maybe they should have abandoned the OS too?

>Tom, just give up on this Gavan character. All you will accomplish is more
>and more flame posting. Let "us Jaguar people" get united!!! :)

ahh, `Jaguar People` now, is it? Seems like the Falcon has got
dropped! Maybe its as well you concentrate on a game system, as the
only thing Atari has ever successfully sold was the 2600 VCS system.

Its not like they havent had good products (OK, so the ST was
pretty crap but it actually did quite well before the Amiga wiped
the floor with it!) - The 8-bit 400/800/XL/XEs were superb machines,
probably the best 8-bit computers ever. The Lynx was and is by far
the best handheld and the Falcon has a lot of good points, but all
pretty much failed.

Its a pity Sega or Nintendo aren`t making the Jaguar, if they
were we`d be seeing 30+ games at launch with dozens of software
houses developing for the machine. As it is, it has 50-50 chances.

Sad, but true.

only PARTIALLY true. The Falcon Developer docs say (and I AM quoting)

"Use enhanced joystick for all joystick-oriented games; CX-40 style controls
should not be supported"

THis means that until the new controllers come out, Atari is saying to not
make any games. Sure, some developers have already come out with games,
but once the controllers are out I think many more titles will come out.

Maybe we should start a newsgroup for Gavan called comp.sys.abortion.advocacy
jeez, this guy is so stupid...

There;s a complete story in an old ST mag which I happened to randomly reread recently that told the whole story of the birth of the ST. It is true that an early prototype of the ST ran off a modified CPM, and there was much debate over whether they should kep CPM or continue with GEMDOS, which was a whole new OS. They decided to go with GEMDOS, which is what we had. THen when miNT came around (Which originally stood for MiNT is Not Tos) as an independant OS that could MultiTask on STs, it became rather popular, so Atari bought it and Eric Smith, the creator, and now we have MultiTOS, which is a complete replacement for the OS. It was built with Multitasking in mind from the ground up. Happy now? No, you'll never be happy. Grunt.

Yeah, they should port NeXT-Step to the Falcon. After all, the Falcon
is not that much different from the original NeXT-Hardware, at least
more similar to it than an Intel-machine. And, as everybody says,
Atari is cooperating with IBM on the Jaguar, and IBM has NeXT-Step
licenses, so...

Gavan, I have been reading your posts long enough to know that you just love yanking Atarian's chains (and that your basically full of it), but I just thought I should warn anyone else who is not familiar with your tactics. I won't deny that the Falcon has not sold as well as we would all like and therefore there is not as much software developed as we all would like, but you are dead wrong in saying it is dead. There is a fair amount of new and interesting software coming out, all of the old ST stuff that was writting properly still works, many programs are being updated to work even better, and there are utilities to enhance compatibility so that even many ST games work on the Falcon.

Fact is, it is a better machine with much more potential than any current Amiga offering. Whether or not that potential is realized (or how long it may take) is another story. It doesn't keep me from using and liking my Falcon.

When the SNES was released there were far from 30+ games available.
In fact, besides the CD32, I can't really name off a system that had an
impressive amount of games upon the launch. When the SNES came out there
were 2 other games...Pilotwings and F-Zero... When the Genesis came out
you had Space Harrier II, Thunderforce II, and a few others which were
pretty tough to find (around here at least). The CD32 has a LOT of
GOOD software out NOW...which is more than I can say for my Jaguar. I
like my Jaguar, but I'd really like some damn games... BUT..the system
hasn't been formally released yet, just in test markets and in places where
the test units leaked out (like over here in Mass). So, I assume in January
we'll have a good selection of games (maybe 5 or so.. hopefully).

Yes, this is the first time this guy is right.
The Falcon sales are poor. That's the truth.
It's sad to see people purchasing the wrong computer. They walk in one of
these horrible discounters and a few minutes later they are "lucky" owners
of a Intel-based machine (and, of course, it's not an Amiga Gavan!).
Let's face it: the Falcon is a very nice machine but there are very few
people buying one (personally I think the Falcon is the BEST homecomputer
but I try to be objective :-).

Ciao, Heiko.

Understood but just how many variations on a RAM expander/accelerator do you need? I would be the first to admit the Falcon lacks a real killer accelerator board but everything else I am likely to want is available. Also, as I said, the list wasn't exhaustive, just what I could remember as I typed. I'm sure if I picked up a few Atari mags and typed in all I found, there would be plenty more software.

|> ram/fpu expansions, 50+ games (and all OS legal software which is of
|> a far greater range and quantity than that available for the ST)
For me personally, this isn't a problem. I don't tend to play games (although I have a Jag on order so that may change :-) ). I never really played many games on my old ST either. I've always used it for programming, spreadsheets/wp/database/music etc.

|> that benefit appreciably from the AGA chipset and faster processors
|> of the A1200 and A4000. Add to this the ability to run the vast
|> majority of normal (16-bit) software which the Falcon lacks (It
|> seems to be completely incompatible with all non OS-legal ST
|> software) and you start to see what a poor choice the Falcon owner
|> has compared with the A1200 owner.
I agree that the AGA chipset is well designed re compatability but all the various Amiga incarnations have had their fair share of incompatability problems. FWIW, out of 300Mb of Atari software both PD and commercial, I had 1 spreadsheet program and 3-4 PD utilities that broke on the Falcon. That was better than when I went from ST to Mega STe by a long shot. COnsidering the OS/video/audio is totally different on the Falcon, that's not bad. I generally run at 940x684x16 colors on the Falcon and nearly all software runs fine at the non-standard rez. Only the odd ancient GEM prog gets confused and then it's just a case of dropping back to an ST compatible mode like hi-rez mono and away it goes again.

|> Why would an ST owner choose a Falcon when nearly all of his
|> games would stop working and there is such a limited range of stuff
|> available? It would make more sense to pop an accelerator card into

|> the ST.
If you just wanted more speed then sure, this is very true. An accelerated ST will be a lot faster. BUT, I wanted more color (65000 of 'em) as well as much higher resolutions (I have coaxed 1400x600x16 out of the Falcon - I could get more but I couldn't read the text on screen anymore). I also liked the sound of the Falcon only stuff like super-smart telephone answering machines, being able to sample 4 16bit tracks direct to hard disk (I've recorder 3/4 of a U2 album to my external HD and it sounds great played pack. Not CD quality but then I was only at 16Khz). The DSP makes loading JPEGs a breeze and the newer art/graphics ackages use the DSP to good effect for really speedy transformations and morphs. At the end of the day it's horses for courses and I wanted to run my very extensive ST library quicker and with more screen space as well as wanting access to the new software that's around. I'm very glad I bought it and have had no regrets. I did look very hard at PCs (I use 'em at work sometimes and just couldn't face Windows 3.x at home), Macs (too expensive software), and 1200s (At the time, the 1200 was just released and plagued with problems ie no manuals, RF box problems, hardware & software problems etc.)

|> BTW How is lattice C Falcon specific? Don`t you just mean
|> that it will compile things faster?
I did say Falcon enhanced/compatible. Lattice now has libs for all the falcon hardware/system extras as well as MiNT, Speedo GDOS and lot's of other goodies. It has compiled 68030 code for sometime so that wasn't really new.

All the early ST books and sources gave out the CP/M68K line but later ones I have read and also various bits of chatter, comments from Atari etc.
What I have read/ben told by people who ought to know is that the prototypes ran modified CP/M68K and that was the source of the confusion. The final release was much closer to an MSDOS type of OS but then MSDOS is also quite like CP/M in many ways. I *may* be wrong but This is my understanding of the matter.

|> Anyway, TOS was designed as a single tasking, single user OS and

Sounds like Atari.

|> Now of course we have an official multitasking version of TOS,
|> but the problem is that TOS was never suppposed to be multitasking
|> in the first place, so the resulting system suffers from memory
|> inneficiency, lack of speed and incompatibility with a lot of older
|> software, even stuff that was supposedly os-legal.
MiNT replaces large portions of GEMDOS, virtually all the AES and several other chunks. MiNT is very efficient, it's the current AES that is a system killer. The next version is considerably better to the extend that (I'm told) an MTOS system is only about 10% slower than a TOS one.

|> Since the Amiga always had multitasking, the OS has been able to
|> evolve into a much more efficient system, rather than having things
|> hacked on.
At this time this is probably true. The AMiga OS has improved a lot since it's early days. I just wish the desktop wasn't so aweful. That's one of the things that really puts me off the Amiga. Nice hardware, grim interface. IMHO.

|> Atari pretty much decided to drop the ST hardware when they made
|> the Falcon, maybe they should have abandoned the OS too?
Too much software out there to do that. TOS is OK. Very nice to program and nowadays very stable and efficient. MTOS is still fairly new but in time I'm sure it will mature into a nice system. MiNT is already very good. It's very like Unix under the bonnet and porting Unix stuff is fairly trivial as long as it doesn't use certain types of functionality like networking etc. I'm sure this will come in time though.

In the UK, the CD32 has been on sale for many months with only the CD that it came with being available. Only in the last month or so has new stuff appeared. Even my die-hard Amiga fans were steering clear of it because of the zero software situation. Now it's better.

Dear Netters,

Here's wishing you all the best in the festive season, and for the coming New Year.

Christmas means different things to different people.....presents for some..... religion for others.......and party time for the rest.

I am not a Christian, but do believe in God. As this is a celebration for the birth of Jesus, I too celebrate Christmas. I believe that all the religions teach the same thing, and so there should be no difference between people of different religions.

Basically, all religious teachings come from the one great power, so all religions must be the same....just preach it differently.

So, let's celebrate Christmas, with love and goodwill for one another.

Peace.

Danny.

Actually, I can't totally agree with your assessment, I have an Atari MegaST4 with the Spectre GCR and the Turbo 16. I also have a Macintosh Quadra 800. I love both machines but from a professional and speed stand point, the Quadra is a much better machine. I plan on upgrading it to the PowerPC in March. I'm not ragging on the Atari, my first 4 computers were ataris, but to maintain compatibility with my work computer and to get access to a lot of professional quality software, I had to get the Mac. I think that the atari computers and the commodore computers will always be there but only in a niche type environment. I am considering upgrading my ST to a Falcon though. I'll just have to wait and see what happens with atari and the Jaguar before I sink anymore money into another atari computer. By the way, I own and love my Jaguar.

Ken

I'm afraid it is unique, with respect to compression. The Jaguar and the 3DO have DSP that are well adapted to compression at fast speeds. Atari have recommended a compression technique, and as far as I know, have included some routines in hardware.

Your post is very subjective. An Amiga owner I presume.

Is this the guy that continually suports ands props up the CD32 in any debate? Is this the guy who attacks, puts down, and generally whinges about every element of the new Jaguar?

I really get pissed off with this tribalism. You get amiga owners coming in here and spitting and howling about their new machine, and clawing and pulling down the Jaguar at every oppurtunity. There are a few exceptions.

Why cant people just debate. Forget the fact that if this machine makes it, your machine or the company that produces your machine will hurt. If the Jaguar gets big, it will really impact on the slaes of the other comsoles. Forget this.

I hope that this Gavan character shows some signs of maturity soon.

Not true. The base functionality (file system, memory and process
management) is a lot more like DOS.

> Anyway, TOS was designed as a single tasking, single user OS and
> didn`t have much in the way of features.

TOS always had cooperative multitasking, but in a very limited way:
One main application and up to six accessories.

> Now of course we have an official multitasking version of TOS,
> but the problem is that TOS was never suppposed to be multitasking
> in the first place, so the resulting system suffers from memory

Have you ever seen Mag!X in action? Preemptive multitasking and
still lightning fast - in fact, faster than single-tasking TOS!
This shows that it can be done efficiently, even with the OS
basis that we have. It's just a matter of implementation.

> Since the Amiga always had multitasking, the OS has been able to
> evolve into a much more efficient system, rather than having things
> hacked on.

That's true for process management, but it's not true, for example,
for hardware-independent graphics. The Amiga OS had some deficiencies
there for quite some time. Each OS has its strengths and weaknesses,
and both have some potential, and that's why I don't support your
following suggestion:

> Atari pretty much decided to drop the ST hardware when they made
> the Falcon, maybe they should have abandoned the OS too?

TOS has all the potential to become a very efficient multitasker
with all the major benefits that UNIX gives us. There's a lot of
work to be done, though, and it is still doubtful whether Atari
finally decides to put some resources on system software development.
It all depends on the Jaguar's success.

Gavan may be less informed than you might wish, but that's no reason
to call him stupid.

> over whether they should kep CPM or continue with GEMDOS, which was a whole
> new OS.

Well, rather a DOS clone than a completely new OS. (Note that this
has quite some advantages such as complete interchangeability of
media.)

> and Eric Smith, the creator, and now we have MultiTOS, which is a complete
> replacement for the OS.

Not quite. MultiTOS consists of several modules:

- MiNT: A multitasking kernel that sits on top of BIOS and GEMDOS.
It still uses BIOS and GEMDOS!

- new AES: Can handle multiple GEM applications at a time.

- new Desktop: Can start more than one GEM application at a time;
lots of UI improvements.

The VDI, for example, has not been replaced or changed much, and
we're also still dealing with essentially the same BIOS and GEMDOS.

Thus, MultiTOS is not a *complete* replacement at this point in time.
It has a lot of potential, though.

> It was built with Multitasking in mind from the
> ground up.

MiNT was built with multitasking in mind from the ground up, that's
right, but the new AES and Desktop modules are more an afterthought.
Note that I do not want to bash MultiTOS - I'm using it on my TT,
and I really like it for its *NIX features. But Gavan does have a
point when he says that MultiTOS is slow. It's just not optimized
enough to be a joy to use on a standard ST - the Amiga's OS, however,
offers acceptable performance even on an A500.

>we'll have a good selection of games (maybe 5 or so.. hopefully).

I have seen the 3D0 and All I can say is that you have to be kidding me if you would think about spending $700.00 for that! The only good thing I have seen was good still shots (of the Warner Brothers tradmark). When movement was put in it (with a game especially), it looked like a SNES, nothing more....
It was hooded up the a 27" TV and a stereo (they were trying to play up the sound). However, my CD player can out do 3D0's sound 1000 times over, and it only costs $200.00. Now I know you get graphics for an additional $500, but it is a far cry from virtual reality everyone seems to be raving about. All I can say is that is would take a real stupid sucker to purchase a 3D0. ($700! I can't get over it!!!! At least the VIS was a little cheaper).

All I can say, for $700.00, the sound _HAS_ to be perfect. It has to sound live. It HAS to sound just as good as a CD player playing 8 times over sampling, if not 16! There is NO Excuse for the crappy "recorded" sound that came out of that black box. Where the Hi Hat is hit, it has to sound like there is an actual Hi Hat behing my speaker, not that shabby muffled sound I was hearing....

Oh Well, there is a sucker in every crowd...

--

Where is this CD32??? I have looked all over this Christmas season and I can't find it anywhere. I havn't seen any ads or heard any talk. Is this a real system, or is it just a fantasy the Amiga crowd dreamed up so they can trash the Jaguar?

--

I have yet to see the Jaguar, but I _am_ from cincinnati.

## 3821. new Jaguar !!

Newsgroup: comp.sys.atari.advocacy
Date: 1993-12-23 03:19:07 UTC
From: cs151ns@lamar.ColoState.EDU
Message-ID: <Dec23.031907.81120@yuma.ACNS.ColoState.EDU>
Source record: 19452

Just saw the Jaguar last Thursday - thought there'd be more
first hand accounts, but no - here's my impressions:

I'd been eagerly awaiting [like any of respectable video game geek]
the arrival of the Jag since its anticipation, so I was pleased to
see it when I walked into Run PC [Fort Collins, CO - a great Atari
dealer !!] The Jaguar is a very slick looking black thing. I
was disappointed that they used control pads instead of joysticks
though (but I guess you have to follow the crowd - I'm old school.)
The controllers are like the Genesis ones but with replacable
"command overlays" you put in the center. This is a great feature,
and will make games have a lot more possibilities if 9 other buttons
are possible. Especially adventure games and the like.

The games I saw were: Cybermorph, Crescent Galaxy and Trevor McFur.

The thing that immediately disappointed me was the sound. As a
total audiophile, one of the things that has almost driven me to
buy a Falcon is its _excellent_ sound quality. Trevor McFur sounded
like some old analog bleeps from 8-bit Asteroids! I didn't see this
game very long, but it had some beautiful graphics. If you can
remember "Blasteroids" then you'll have an idea what the objects
looked like. Gameplay was rather tedious though, and this game
didn't look like it had much playing value. Beautiful background
scrolling also, even if it did repeat a little often.

Crescent Galaxy - another beautiful game with about zero playability.
It _is_ fun, but the owner said he was already halfway through the
game and he'd only had it since yesterday (!).. not something I'd
want to drop $50 on.

Cybermorph - probably the best game.. neat graphics, could play it
for a long time..

Could someone put up sound specs for the Jaguar?

My conclusion was that the machine will be a huge success if
marketed correctly (but you all know that :] ) . it just needs
to get a game like MORTAL KOMBAT II or something straight up
DOPE that will make every kid want to buy it.. but I'm not worried
[yet] - remember the first generation of Nintendo games? What
the fuck was Kid Icarus? ugh..

peace

jon

cs151ns@lamar.ColoState.EDU wrote
: Could someone put up sound specs for the Jaguar?

Twelve channels of 16-bit Stereo sound at better than CD-quality
(but don't be surprised if games that use this quality don't pop up at
first - good quality digitized sounds and music take mucho memory.

: marketed correctly (but you all know that :] ) . it just needs
: to get a game like MORTAL KOMBAT II or something straight up

Kasumi Ninja will be released early next year - it is supposed to
be the first larger game (memory wise) - rumors have it that current
Jaguar games are quite small. The developer for Kasumi Ninja says it will
have TONS OF GORE. I think that will get some attention, and hopefully
sell some Jaguars.
Alien Vs. Predator, another supposedly violent game - should be a
definite system seller.

huh ? so if he is not worried about his job he should go to atari ?,
Sure S.Tramiel stated only 20.000 Jags this year .. cbm stated about
600.000 this year add the sega systems and the normal amiga's.

Yep Team 17 must jump fast, becausee non of those systems are selling ;-) ....

: quite badly.

I think it was sold at World for Kids or some other toy
warehouse (really, not making this up).

: Also, in Australia we use PAL. I hope the PAL Jaguar
: does some tricks to ensure all games are fullscreen,
: unlike Amiga which cuts off the bottom 1/3 of the screen
: when you play an NTSC game in PAL mode.

Actually, the newer Amigas allow you to boot up in either
PAL or NTSC modes. NTSC looks rather odd for those countries
using 50Hz power, as it kind of flickers slightly (due to
the overhead lighting) and has rather nasty visible scanlines.
To do the same thing on the older Amigas, you had to use a
special program either on a bootdisk or a small program on
your hard-drive to force it into PAL or NTSC modes.

Message-ID: <1993Dec26.041738.8616@martha.utcc.utk.edu>
Source record: 19464

I keep reading in articles posted that the Jaguar has a 2 MB ROM limit on cartridges. All documentation I currently have states that the limit is 6 MB of uncompressed code and 50 MB of compressed code. My documentation does show a limit of 2 MB of DRAM, but not of ROM. Just curious.

You certainly have a right not to agree! :) I am a student, and so have no need to run "the same software at at work", though I did work for a Mac/PC software developer for a few years... Anyways, my foreshadowing was correct, and sitting atop my MegaSTE and besode my Falcon is a new IBM PS/Note laptop, so I have begun to delve into the wonderful(hah!) world of Windows... so far it operates at a slower speed than my MegaSTE in respect to graphics. and that's a 68000/16 vs a 486/25! hum...

The Jags cart limit is 6 megs.

16-bit sound can be produced from scratch, or digitised - so some
effects may take up little space.

Graphics can be compressed.

The games that are out NOW have better graphics than the SNES or
Genisis or, even, the CD-32. Raiden seems like it will also have
better sound.

>>I myself will be a Jag owner (soon, I hope - damn those fools at FAO Sw.!!)

>

Well, if I lived in one of the test markets I could just walk down and
buy one. Actually, I live in Colorado, and I now know of a store that
has had a few for awile - also the people who preordered from Atari or
Babbages have thiers. My only mistake is ordering from FAo - not
onyones fault but FAO's. I'm gonna call them tomorrow and cancel my
order if they haven't even shipped yet...

The Jag CD is availioable to developers who want one. That's what matters.

Ok, these games are crap (with the exception of Mortal Kombat). But
of course, Acclaim will become a Jag developer soon, so that problem
is solved...

on the other hand, how soon will you see DOOM on the CD-32?

>
> Trying to hype the Jaguar on the basis of its specs is useless.

The proof that CD games will cost as much as or more than cart games
is right before you - how much does a disk cost? How much do computer
games cost? There you go, proof that the reduced media cost means
virtually NOTHING (perhaps $10 at most) in terms of price.

That's what Amiga needs to do as well, concentrate on the game
system. Too bad they released such a shoddy contender.

Actually, the Falcon is still doing pretty well - for almost any area,
there is more software than I need witha a pretty high level of
quality. Like terminal programs - The ST line has Connect, the best
terminal program for any platform.

>
> Its not like they havent had good products (OK, so the ST was

As much as you hate the Falcon, quite a few people are happy with it
and equally glad the do not own anything like the A1200. A lot of IBM
clones sell too, are you saying that the Amiga is as good as an IBM
clone?

> Its a pity Sega or Nintendo aren`t making the Jaguar, if they

Amazingly, you produce a shred of truth. Yes, if Sega were producing
the system you'd see a lot more developers hopping on initially. But
the Jaguar Dev list is growing ever larger, and has a lot of good
companies (now Spectrum Holobye is included... a few others as wel).

>the Jaguar

This is wrong - just look at Dragon's Lair and Night Trap. Both are
out for the 3DO and Sega CD. The 3DO versions have much better sound,
and graphics.

Obviously, when moving stuff to a new machine, a good developer takes
time to enhance the game at least a little, or use some of the more
powerful features of that machine - thus the SNES version of MK is
better than the Sega's in some waysd but not in others.

Now with a CD-32 game, they can just put the game on a CD and they are
done. Where is the incentive to add anything at all?

Why buy a CD-32 if all the software sucks?

In all seriousness, the reasons I bought a Jaguar are:

1) Raiden is coming out, play and soundalike.
2) Cybermorph looks great to me
3) AvP should be really good
4) DOOM is a really great game, and the Jaguar will have a version
hand-crafted by ID themselves.
5) Battlewheels (someday)

6) Enough other real developers are on now that I can say there will
probably be more Jag software around that I want than I can afford to
buy. From the CD-32 list, only 1 or 2 titles interested me (MK was one).

But All of the normal ST apps run just fine on the Falcon, and the run faster since it is a faster machine. If I buy an accelerrator, then it will run faster still.

As for games, I have got 90% of my games to run on my Falcon just fine using a program like backwards. I'll bet more games break on your A1200 than my falcon.

>
> Why would an ST owner choose a Falcon when nearly all of his
>games would stop working and there is such a limited range of stuff
>available? It would make more sense to pop an accelerator card into
>the ST.
>

The answer, oh Simplistic One, is that they still work. Actually, some of my games that wouldn't run on an STE run on my Falcon!!!

>BTW How is lattice C Falcon specific? Don`t you just mean
>that it will compile things faster?

Real programmers use GCC anyway... but I believe that Lattice C does in fact have Falcon libraries for special Falcon OS stuff.

Why, you're right!! Just look at the similarities:

1) not using thier own account

2) have no idea what they are talking about

3) make up stuff as they go along to pad thier already shoddy amount
of knowledge

4) Seem to lack any ability to learn from other posts

5) Apparently post just to draw flames (well, at least here they achive)

sure ...

You still don't seem to get the reason for cbm to have the cd32 do you ?
The (as atari) needed money fast. take a look at some facts :

a) cd32 did save cbm for now
jag is still not sure for atari.

b) cd32 will create a flux for the cd addons on the rest of the amiga line
in the future.

c) cd32 allready sold more units _NOW_ than atari even hopes to ship
before 1995.

d) cd32 needed far less R&D and this R&D had to be done anyway for
the normal amiga line.

e) Lets be fair the jag blows the cd32 away BUT screams for
a cd 'size' memory device.

f) Sales, even if more people wanted to get the jag it will _not_ be
possible. These company's wanne sell units all this 'test areas'
stuff is bullshit if atari was capable of making the same amount
of units the would have xmas was missed and xmas 1995 is a LONG
way to go.

its about making money look :

---
CD32:
Liberation CD32 is the top selling CD game in the UK according to Gallup,
outselling Sega CD titles and Rebel Assault on PC-CDROM. Dixons group,
the UK's largest electrical retailer has justed started to stock CD32 and
took delivery of 30,000 on Dec 10th. Previously Dixons had resisted
stocking the console because of a commitment to Phillips CD-i. HMV
are also now stocking CD32 and software. Mindscape (publishers of Liberation)
are so pleased with sales that they have commissioned five CD32-only titles
for development this year. No details are available at the moment.
---
The FMV module is ready, but high sales of CD32 and A1200 has held up
production. Release has been put back to January to allow for the
production of sufficient launch stocks.
---
Jaguar in uk:
A few hundred Jaguars arrived in the UK on Christmas Eve. My local dealer
got one. There were no software titles available except Cybermorph.
General opinion after playing was that it was dissapointing given the
specs of the machine. No more are expected until March. So far HMV are
the only non-specialist retailer to commit to stocking the console.
---
"IBM is contract manufacturing the unit in its Charlotte, North
Carolina facility, and Atari said initially it expected to ship
50,000 units before the holiday season, mostly to New York and
San Francisco stores. Now Atari has lowered those numbers to
20,000 units to ship before December 31, 1993 due to production
and supply problems. The disappointing shipments appear to have
hurt Atari's stock, as it has been falling steadily since the
November high.." (Sam Tramiel, before xmas)
---
In a press release dated 15 Dec 1993, Atari US have reported production
problems with an unusually high failure rate of Jaguars on the production
line. Full-scale production has been scaled down until they find the
source of the problem, but most people suggest that the Jaguar should be
available in large quantities around March next year.

---
the official figures for CD32 sales are out. Worldwide sales are 400,000 units,
and production is being held back by the need to produce more A1200's to cope
with the much heavier than expected demand for that system (C= sold 160,000
A1200's over the 6 month period to October, when sales are usually slack.
Currently A1200's are selling at 12,000 a week, and CD32's at 30,000 a
week. CD32 is currently outselling the Sega CD by 4 to 1. David Pleasance
of C= said "We've been inhibited by our inability to manufacture enough
machines. Sales of the A1200 have held back the CD32 because we've had to
make so many more A1200s. We're certainly not complaining though!"
---
Interestingly Martyn Brown of Team 17 was quoted in an artical in CU
Amiga magazine as saying that among their CD32 releases for next year
would be Alien Breed 3D which will use the CD32's Planar chip. Sound as
though this might be the CD32 equivalent of Doom.
---
According to David Pleasance, C= have been rehiring engineers and are
already at work on the next two generations of CD32. The current model
range (A1200, CD32) will be retained for at least twelve months.
Speculating, it seems likely that these new consoles will use the AAA
chipset and either 030 or 040 processors, or possibly a RISC processor,
probably from HP.
---
The first magazine specifically for the CD32 is due to launch in the UK
mid-january. Called Amiga CD it will include a CD coverdisk. Rumours are
that this will contain a demo of the CD32 version of Frontier - Elite II.
Previous comments from David Braben indicate that this will be specially
tuned to 020 and will run at a similar speed to the standard version on
an A4000. It should also use Akiko to provide texture mapping as seen on
the PC version.
---
A number of companies are apparently at work on 030 and 040 accelerators
for the CD32 based on existing A1200 units.
---
Silmarils are working on CD32 and Jaguar versions of Robinson's Requiem.
CD32 release is due february with the Jaguar release sometime later in
the year. The game uses a brand new texture mapped polygon graphic system
and is reckoned to be the first CD32 game to use garaud shading.
---
Optonica are producing a series of multimedia guides for CD32. The first
qInsight Technology takes and in depth look at how common technlogy works.
Due for release next month, it will cost about 34 UKP ($50).
---
In the UK Amiga software is sold at a 2:1 ratio compared to PC software, last
month the average was (on ALL software sold) 1st: Amiga 62%, 2nd: PC 28% .. This
is from the UK software business magazine CTW concerning games sales.
---
SUNNYVALE, CALIFORNIA, U.S.A., 1993 DEC 14 (NB) -- Atari reported
larger losses than expected in its third quarter earnings,
despite the introduction of the widely heralded Jaguar compact

disc read-only memory (CD-ROM) game system. The company said while it expects the Jaguar to pull it out of the red, it doesn't expect to be profitable until 1994 when it says it will ship half a million Jaguars.

Net losses were $17.6 million, or $0.31 per share, on net sales of $4.4 million, compared to the $1.9 million profit reported on $34.5 million in the same quarter last year. This means another quarter of losses for Atari, who reported a net loss of $6.6 million, or $0.12 per share) on net sales of $5.7 million in the second quarter 1993.

The losses are being attributed to write-offs of about $7.5 million of its own personal computers Atari has in inventory, as well as write-offs of older video game products. Restructuring costs of $6.4 million have also dug into the company's pockets with the "wind-down" of its Australian operations and the declining value of real estate in Europe owned by Atari.

Atari has been struggling for some time, and its stock prices reflected that struggle with shares going for between $1 and $2 each -- until Jaguar. The big hope for Atari has been the Jaguar, its $250 interactive, multimedia CD-ROM game machine that connects to a television and could give its nearest competitor, the $700 3DO system, a run for its money. In May Atari's stock began to see life again and by the official announcement of Jaguar in November, Atari's stock had reached a high of over $12 a share.

But there was speculation at the release of the Jaguar in November of this year that Atari might not be able to meet demand. That has turned out to be the case.

IBM is contract manufacturing the unit in its Charlotte, North Carolina facility, and Atari said initially it expected to ship 50,000 units before the holiday season, mostly to New York and San Francisco stores. Now Atari has lowered those numbers to 20,000 units to ship before December 31, 1993 due to production and supply problems. The disappointing shipments appear to have hurt Atari's stock, as it has been falling steadily since the November high, closing yesterday down an eighth at 6 and 7/8.

Sam Tramiel, Atari president, is still very optimistic. He said the company can get 500,000 of the game machines out the door next year, but qualified the numbers saying the shipments are subject to market acceptance of the Jaguar, the availability of parts to build the units, and the transition to volume production. Atari is also pointing to cash reserves of $34 million, down only $1 million from the $35 million it had on June 30, 1993.

"The Company is in the process of completing its transition from
a historical focus on older technology consisting principally of
16-bit personal computers and 8-bit video game systems,"
according to Tramiel. Time Warner has a 25 percent stake in the
company, which is one of the biggest reasons some investors still
hold hope that the Sunnyvale, California headquartered company
has not made its transition too late.

g)

So what does this tell you ?, that the Jag is capable of killing the cd32
(if it had a cd) but it _WILL_NOT_HAPPEN_ before xmax 1994. but by then
the cd32 has done its job it saved cbm, made a standard for cd's on
amiga's and prepared the cd32 (and addons/followups) for the next round
of games/multiemdia IF cbm wants (or capable) too.

Happy NewYear,

Daniel.

PS: Im i the only one that finds it weird that they call the jag a
'multi media cdrom based games machine' when there is no cdrom ?

All CD32 software does not suck. There is a LARGE supply
of G O O D software out for the CD32. Which is more than I can say for
my Jaguar. Hopefully Jaguar software development will pick up by
next Xmas.

: Umm, it runs at 30FPs. How many more frames does it need?

You missed the animation bit. Imagine Mickey mouse moving across
the screen. Problem is, it's a static image and frozen Mickey's
floats across at 30FPs. Now have Mickey's arms, feet, legs, head
moving. Which is better?

Besides, what does 30 frames-per-second actually mean? I could
page-flip a square mouse cursor around the screen at 30fps, but it
lacks quite a bit in the animation stakes.

- Jim

Ok, you guys are on totally different wavelengths. The "lacks frames of animation of the objects" comment was directed toward Crescent Galaxy. The "30FPs" comment was in regards to Alien vs. Predator. The final (I hope) comment is once again about Crescent Galaxy.

I like a good argument as much as the next guy, but please argue about the same thing!

Tom

I think that figure is rather doubtful, myself. I have heard many
confliting reports on this. They may have sold a lot, but I doubt
that over 500,000 units have been sold...

>
>d) cd32 needed far less R&D and this R&D had to be done anyway for

This all sounded a bit fuzzy to me... the national release will be in
early january, they will have plenty of time to build up to a really
goon '94 christmas!

<some of the following items have been removed>

While it is true they may not be activley pursuing that market at this
time, they probably will after they get a strong foothold in
America... which it looks like they can do.

Once again, I'll bring up commodores stock, which has not done
anything at all, and is still lower than Atari's (which is going up
again). The stock price lowered in response toa CNBC buisiness report
that said 3DO stock was way overvalued, and that Atari's stock should
really be about $5. Both stocks then plunged dramatically, due to
market sheep at work. I believe both stocks will rise again. Atari
is already on the way up again...

As for the production problems, at least part of that was the bad RF
switchboxes. For the national release, that will no longer be a
problem.

>---------------------------------------------------------------------------

Well, I would hope they are doing some R&D - the question remains if
this new chip set will be equal to the Jaguar.

>Silmarils are working on CD32 and Jaguar versions of Robinson's Requiem.

>

Now those are the first rational reasons I have seen for the CD-32's
existance. I too believe that the Jag will not become large until
about christmas '94 - but it should have a lot of really impressive
games by then. The problem I see with releasing a new version of the
CD-32 at that point is that you have to compete against machines that
are probably just as or more powerful, while the other machines have a
bunch of great titles and the CD-32 has just old titles...

It is very well known that they could only get about 50,000 chipsets in '93.
What's your point? They will not have that restriction in '94.

>------------------------------------------------------------------------
>CD32:
>Liberation CD32 is the top selling CD game in the UK according to Gallup,

>November high.." (Sam Tramiel, before xmas)

That had nothing to do with the stock price falling. It was overvalued after the HUGE leap from around 5 to over 12. It then pulled back to around 8-9. Then Dorfman on CNBC dropped a "the analyst I spoke to says it's gonna drop to 4" bombshell, and guess what? The stock has been going down ever since.

>------------------------------------------------------------------------

When more powerful machines are available, people will buy them. If there is no real competition, and lots of people are Commodore fans already, then there you go...

>------------------------------------------------------------------------

Sure. Keep dreaming. We've already seen beta versions of Alien vs. Predator running, and ID is currently working on DOOM for the Jaguar. And you have the nerve to talk about "not here yet." "Sound as though this might be". Good one!

>------------------------------------------------------------------------

I don't give a mighty crap if it kills the CD32. It already kills the CD32 in
the USA, doesn't it? And that's where I live, so that's where I want to see
Atari on top.

Who is "they"? Are you dim? It's called a "64-bit interactive multimedia
system." Can you say that? I knew you could.

>

O, get real if atari still had there own production pos. and was able to
take the xmas 1993 they would have. shifting it a year will make it still
possible but far from a 'take sega in 5 min. job' they could have done
this year (for example it gives all the other players 1 year to react).

>
>>b) cd32 will create a flux for the cd addons on the rest of the amiga line

400.000+ units before xmas sale is stated bij cbm several times (incl. by
the head of cbm uk (main group behind the cd32)).

>>
>>d) cd32 needed far less R&D and this R&D had to be done anyway for
>> the normal amiga line.
>>
>
>But this will cost them in the end.

huh ?? why you expect the jag will not only kill the cd32 but also the
computer amiga line ? Get real as a console the Jag is really cool but its
not a computer and it never will. we have seen some 'amiga-killers' the
last few years come and go ALL had better specs (remember the geo-neo or
the falcon ?).

>>e) Lets be fair the jag blows the cd32 away BUT screams for
>> a cd 'size' memory device.
>
>Which it will get later on. I still think that a large number of
>really good games can be done on a cart - like Cybermorph.

its not here and it doesn't make my statent less correct the Jag screams
for a cdrom and not all units will have one ...

>>f) Sales, even if more people wanted to get the jag it will _not_ be
>> possible. These company's wanne sell units all this 'test areas'
>> stuff is bullshit if atari was capable of making the same amount

> -------

oops 1994 ;-)...

>This all sounded a bit fuzzy to me... the national release will be in
>early january, they will have plenty of time to build up to a really
>goon '94 christmas!

its simple, you keep reading Jag fans/owners writing that this 'test
areas' thing is a good thing, its not. If atari was capable of getting it
out in real numbers this xmas they would have if you don't beleave this
you are just plain stupid. (lets say they would have sold 200.000 -
300.000 before xmas it would have set the console sector on major state
of panic, and atari a stable company for the next 1-2 years).

>America... which it looks like they can do.

yes you are right but it will not happen before : a) they can make more
jags then they can sell. b) a cdrom is included. BOTH will not happen soon
and THATS why i beleave that all this Jag is the best thing ever to see the
face of the earth stuff maybe a bit to soon (remember the falcon vs a1200).

Thats fair both should be about the same IMHO im not screaming here that
cbm is a great company and they will rule the world. but some of the
people here (and the video.misc group) don't seem to understand that
its not only about specs.... (anyone who claims a a1200 is beter than
a falcon030 needs a reality check. but anyone not accepting the simple
facts that the a1200 is a hit and the falcon not needs one too).

>As for the production problems, at least part of that was the bad RF
>switchboxes. For the national release, that will no longer be a

You are 100% correct i didn't include all these messages on there
own merits but more to set the mood. (hell i am not even sure my 4000/40
can pull a 100% doom conversion).

>this new chip set will be equal to the Jaguar.
>

Yep and then nope the mistakes at both atari & cbm where not made
yesterday cbm pissed r&d out of the door 1987-1989, then started on
AA and never stopt. it will not even be close to the jag chips it
will (and should IMHO be a chip set for a computer not a console) be
a good solid system for the next amiga line ...

>CD-32 at that point is that you have to compete against machines that
>are probably just as or more powerful, while the other machines have a
>bunch of great titles and the CD-32 has just old titles...

so they just don't followup on the idea .. see the difference both
atari & cbm needed a console to save there ass. cbm made a simple/cheap
machine that works this year and will return to the amiga line. Atari
will atleast have made a super-dupper-all-killer-machine but this is
may work out the wrong way (like it did with the falcon). And what
will happen to the computer line it the jag does become the number one
console ?

Sorry about this i didn't post all these small items to be taken as facts
more to set he mood of the moment. You are right doom is possible on the
jag and not possible on a cd32 (again IMHO)...

>>---------------------------------------------------------------------------
>>According to David Pleasance, C= have been rehiring engineers and are

>
>And why do you think they are doing this? Because they felt like it? Or
>because the Jaguar (and 3DO for that matter) blow CD32 away?

please read between the lines .. this is just the next amiga chipset, they
will have the option to go ahead or pull back (Atari & 3DO don't have
those oiptions anymore). I expect cbm to pull back the cd32+followups if
Jag en/or 3DO will take of ... THAT is the good thing IMHO about what cbm
has done (good gaines/no risk) ...

>>
>> So what does this tell you ?, that the Jag is capable of killing the cd32

yep sure selling 400.000+ units before xmas against 20.000 units before
31 Dec. cd32 is not even out in the states yet if CBM wants to (and this
is still not sure) it can have more units in the states then atari in a
week ... we will see what happens on the ces .. (again im not sure if cbm
even plans/needs to take the US as a battle ground).

>>Happy NewYear,

Randy Lexvold (lexvold@martha.utcc.utk.edu) wrote:
: I keep reading in articles posted that the Jaguar has a 2 MB
: ROM limit on cartridges. All documentation I currently have
: states that the limit is 6 MB of uncompressed code and 50 MB
: of compressed code. My documentation does show a limit of 2 MB
: of DRAM, but not of ROM. Just curious.

It's more of a cost-benefit restriction than anything else. ROMs
are generally expensive to make. Bigger ROMS = bigger cost. For
the SNES and MegaDrive/Genesis games, bigger roms = higher price.

:#virtually NOTHING (perhaps $10 at most) in terms of price.

Look at Neo-Geo carts and tell me they couldn't use a CDROM. The cost of
ROMs drove the price of Neo-Geo games through the roof of most wallets.
Remember, Neo-Geo games needed large amounts of ROMs.
As yet, none of the Jaguar cartridges available use anywhere near the full 6
megs, and until the price of those games come out you can't prove anything.
I think you'll find that the more ROMs that are needed for a game, the
higher the cost.

For a smaller base of users, CD will cost more.
For a large base of users, CD will cost less.

No arguments here :)

>oke please inform me where the other 30.000 are (Sam T. stated only 20.000
>before 31 Dec.) and what is so special about 1 jan 1994 that will solve
>these problems.

The availability of chipsets made by Motorola instead of the unknown
Japane subcontractor. (So o.k. not jan. 1.) Motorola will produce 1
million chipsets in 94 taking away production limits and providing a
reliable second supplier.

>>When more powerful machines are available, people will buy them. If there is

????

>Sorry about this i didn't post all these small items to be taken as facts
>more to set he mood of the moment. You are right doom is possible on the
>jag and not possible on a cd32 (again IMHO)...

Agreed. To add one more touch of realism to the other side (yeah, even _I_
am not that biased). A programmer told me a game like Sim City would not
be possible on Jag. Because of the fact 90% is simulation (number
crunching) and only 10% graphics, a 68000 was too slow. Maybe they could
use DSP though. Anyway, each system has it's strongpoints.

>please read between the lines .. this is just the next amiga chipset, they

Based on numbers sold, CD-32 will not be pulled back. Too much investment,
userbase, developer commitment already. Don't forget, this was C='s last
straw too!

>yep sure selling 400.000+ units before xmas against 20.000 units before

I'd say more than that liked it - it seems to be a really fun game to
play. Like I said, I've only seen two posts from people who had owned
Jaguars saying they disliked the game - but one was from Marc Blaine
(who would now have liked Cybermorph or the Jaguar if Atari had paid
HIM $250 to take a Jaguar). I've seen at least 10-15 posts saying how
good they thought the game was...

No, but I think that there are enough games of different types to keep
almost anyone happy... Driving games, shooters, scrollers, fighting
game, DOOM type games (AvP fits in this category). These are also all
game that will be out at the end of January... plus there are
developers working on other interesting stuff, which should follow a
month or two after. There are certainly more games coming out soon
than I can afford to buy, anyway...

>the falcon ?).

No, I don't think the Jag will kill the computer line... just the
current CD-32. What I mean is that they should have put a lot more
R&D into the game system and really souped up the performance. Now
they have a product out, and they have to let it go without
enhancements for a year or so at least if they don't want to piss off

current owners. This gives the Jaguar and 3DO a good lead on games
that are a lot more impressive looking/sounding. While that does not
nessicarily mean good gameplay, it seems that a lot of the stuff
coming out for the Jaguar or 3DO does have good gameplay.

>
>>>e) Lets be fair the jag blows the cd32 away BUT screams for

>its not here and it doesn't make my statent less correct the Jag screams
>for a cdrom and not all units will have one ...
>

Yes, it does ask for a CD-ROM drive... but good games that are
visually impressive with good gameplay are coming out. Since the
whole point of a game system is to play games, this is not nessicarily
such a big disadvantage. I personally think it is better to offer the
CD as a seperate unit and sell the base cheaper - you sell a lot more
base units, which helps to bring in new developers and new
enhancements.

>>>f) Sales, even if more people wanted to get the jag it will _not_ be

They said they had only 50,000 of the TOM and Jerry chips that make
the whole machine - they are now having Motorola produce them, so no
shortages should be evident next year.

>

I don't think the inclusion of the CD-ROM is a nessicary condition to
slaes in Europe - though I do think what will end up happening is a
large flow in the USA first to make sure they meet demand, and then a
slow trickle about March or so for the UK building up over time.

I really don't think the A1200 vs Falcon thing applies here - unless
you want to say the the Jaguar will absolutley dominate because it
costs less than the CD-32... :-)

Yep, Doom is pretty amazing - i really did not think a 486/33 could
run any kind of game that fast - much l;ess with texture mapping!!
Alas, the machine I play it on does not even have a sound card, and
only has a VGA monitor.

Well, I personally think that Atari will still have a computer line
for a while. They just like the computer buisiness too much to
leave. It seems to me we now have a race between Atari and CBM to
develop the first PowerPC machine! That probably is quite optimistic,
though.

>>>PS: Im i the only one that finds it weird that they call the jag a

Well, the devlopers really seem to like the Jaguar! I think that does
say something good... You're right though, the hype has helped them a
lot - the media really swallowed the "64-bit" thing hook, line and
sinker! It really is amazing how little homework the media do for any
topic, much less video game systems.

I know Marc Barret, he is an enemy of mine, and let me tell you, sir -
you are no Marc Barret. :-)

I think a little reality is a good thing as well. Rational
discussions are nice as well (though I sometimes am guilty of straying
off myself!)

Now this comment seems a bit off - remember, there are versions of Sim
City out for the Atari ST (8MHZ 68000). They look almost the same as
the PC versions, and seem to run almost as fast. When you consider
the 68000 in the Jaguar is almost twice that speed, and there are
other chips to take care of all the graphics, the Jaguar's 68000
should be up to the task of calculations for future games like these.

>higher the cost.

Is was not just the cost of NEO-GEO roms - it was a small market,
combined with the development cost of the games.

Also, look at 3DO game prices for a similar effect - even Dragon's
Lair, where they just have to plop the video on the CD, then throw in
the control code, costs $50 - as do pretty much all of the 3DO games.

I think Commodore has a good marketing strategy by charging
lessroyalties on cheaper disks - but, when you start to see real
titles that take advantage of the CD rather than ports of old games,
the cost will rise. How much does liberation or the pinball title
cost?

>
>For a smaller base of users, CD will cost more.
>For a large base of users, CD will cost less.
>

I still tend to believe that the cost of large games is going to
overwhelm the media cost - and this still does not account for the
fact that a lot of PC games are pretty expensive, yet are distributed
on disks that cost almost as little as a CD.

## 3854. AtariMag

Newsgroup: comp.sys.atari.advocacy
Date: 1993-12-30 16:49:40 UTC
From: darmok@cats.ucsc.edu
Message-ID: <2fv0r4$rps@darkstar.UCSC.EDU>
Source record: 19390

For those of you wanting a magazine that covers ONLY the Atari line, it is here. It is called "Wild Cat" (formerly "The Lynx"), and deals with the gaming side of Atari machines.

Eight full-color issues each year are published, each one full of opinions, reviews, news, tidbits, secrets, letters, and all that fun stuff. This is a FANZINE, though, and not a professionally-run publication - it isn't biased, but it is only 12 pages long).

If you're interested, you can send $1.50 for a sample issue (or $12 to subscribe for a year) to Phil Patton at: 131 Dake Ave.
Santa Cruz, CA
95062

Sorry, but this time, no subscriptions are accepted from out of the United States.

Well, I believe 20,000 were shipped to Europe, as well. The RF problem is what I would assume delayed shipping of all of the units. Nothing is special about January 1st, except that it begins the year that Atari will be able to get hundreds of thousands of chipsets, unlike this year. 50,000 was all they could get.

>>>the official figures for CD32 sales are out. Worldwide sales are 400,000 units,

>is that what its all about ? they are computer company's ...

Yes, but there is no competition. Companies seem to sell more product when
there is not competition, wouldn't you say?

>>>---------------------------------------------------------------------------
>>>Interestingly Martyn Brown of Team 17 was quoted in an artical in CU
>>>Amiga magazine as saying that among their CD32 releases for next year
>>>would be Alien Breed 3D which will use the CD32's Planar chip. Sound as

Atari and 3DO already have the best machines. Therefore, they will not need
to think about building better ones for while.

>>> So what does this tell you ?, that the Jag is capable of killing the cd32

>>system." Can you say that? I knew you could.
>
>it stated cdrom to start with and please explain the multimedia part to me
>if you want ...

You want me do define multimedia to you? Look it up. And it doesn't mention a
CD-ROM. Atari never called their machine a CD machine, or a CD-based machine,
or anything like that. The CD is an option. If you like to think that playing
movies would make it a multimedia machine, than the CD option will take care of
that. It's an option, as it is an any machine.

Tom

Yes and they cut 65% in overhead and will make a protif (oke this is IMHO)
in the this period. Atari is taking a bigger gamble this is needed because
the company is smaller to start with.

>
>>yep sure selling 400.000+ units before xmas against 20.000 units before

>
>Where did you get the 400.000? By the way, If you want to succeed, US is
>an IMPORTANT market.

The numbers are from the head of cbm-uk, i am not sure if the newer higher numbers are valid. in the same time (6 months before xmas) they sold 160.000 a1200. And for cbm the us is _NOT_ important 80%-90% of sales are in europe (Uk,germany and Italy) and countries line Australia and Canada.

The only NOT cbm numbers that will give some idea of how the system is doing is the sales nunbers ..

---
UK CD games market share for Nov 93 (Gallop)

Sega MegaCD 38.8 percent
Amiga CD32 37.5 percent
PC CD-ROM 20.2 percent
CD-i 3.5 percent

CD32 up from 23 percent in October.
---
Liberation CD32 is the top selling CD game in the UK according to Gallup, outselling Sega CD titles and Rebel Assault on PC-CDROM. Dixons group, the UK's largest electrical retailer has justed started to stock CD32 and took delivery of 30,000 on Dec 10th. Previously Dixons had resisted stocking the console because of a commitment to Phillips CD-i. HMV (see note on Jaguar below) are also now stocking CD32 and software.
---

Simple fact HMV & Dixons have no need to 'hype' the machine, taking 30.000 units is a sign that _they_ like the numbers on there desks.

>>Greetings & have fun with you Jag,
>
>I will, as soon as our little "Nederland" gets some.

Best bet is to get one from the states/uk, the uk is (i expect) the first country to get them again and they have (HMV & atari UK) stated not before 3 month this year.

>>
>
>True - there are supposed to be 15 games out by the end of January,
>and the National release is right after the winter CES (Jan 4th or so,
>I think).

I think the CES (6-8) will be a VERY cool, we will see if atari have there
act together & we will see if cbm chickens out or go all the way and put
let say 100.000 units in the states at a low price.

>No, but I think that there are enough games of different types to keep

>christmas.

Ofcource not but they where forced to leave this xmas for the other
consoles & 1 year is a LONG time in the computer market. ( He i think
the jag is very capable of taking the market in 1994-1995 but we are
looking at this from a 1993 point of view).

No i meant the cd32 addons for the a1200 & a4000 computers, im also not a
mpeg=movie believer _maybe_ a mpeg=megagames and for sure
mpeg+aga(genlock)+cdrom=mega-kiosk-system.

>also said they were hording units for the US release...
>

Nope the number produces SEEMS (i will & can't confirm this) 500.000+ and
the have stated to keep 100.000-150.000 machines ready for US release but
i will only believe this when huge trucks pull op at the CES parking lot.

>current CD-32. What I mean is that they should have put a lot more
>R&D into the game system and really souped up the performance. Now
>they have a product out, and they have to let it go without

Maybe they don't want to keep it alive ?, maybe it was a move to get
money & create a setup & games for the normal cdroms on the next
amiga line ?

>enhancements for a year or so at least if they don't want to piss off
>current owners. This gives the Jaguar and 3DO a good lead on games
--------------

Be real cbm & atari don't give shit about current owners i have a 4000/40
and i DON'T expect cbm to give me any easy way to the a5000 (they need
money and they know people that can get a 4000/40 can also get a a5000).

Second point WHAT is the _lead_ on games ?

a) best game possible (from user point of view)
b) best game at good price (from user point of view).
c) cheapest to create game (from makers point of view)
d) lowest cost price (from publ. point of view).
e).. etc etc...

Again YOUR point of view may be very valid but there are other groups
that may (will) have a different view and may/are/will choose the cd32
for now...

>that are a lot more impressive looking/sounding. While that does not
>nessicarily mean good gameplay, it seems that a lot of the stuff
---------
>coming out for the Jaguar or 3DO does have good gameplay.
-----------

Again the reviews between some of the platforms is not so clear some of
the early games get better marks/sales than the jag & 3DO games.

>Yes, it does ask for a CD-ROM drive... but good games that are
>visually impressive with good gameplay are coming out. Since the

>whole point of a game system is to play games, this is not nessicarily

>
>They said they had only 50,000 of the TOM and Jerry chips that make
>the whole machine - they are now having Motorola produce them, so no
>shortages should be evident next year.

Yep heard the full story on TOM now and this gives a new view on there
problems but im still a bit scared by S.Tramiel remarks in the 3e kw.
paper on this subject.

>I don't think the inclusion of the CD-ROM is a nessicary condition to
>slaes in Europe - though I do think what will end up happening is a
>large flow in the USA first to make sure they meet demand, and then a

>slow trickle about March or so for the UK building up over time.

If its really a hit they will FOR SURE not meet demands, 500.000 units
in a sloop to xmas is something like (in 3 months blocks) 50.000,
100.000,150.0000,200.000 ... where are these machines for europe comming
from ?.

>I really don't think the A1200 vs Falcon thing applies here - unless
>you want to say the the Jaguar will absolutley dominate because it
>costs less than the CD-32... :-)

Nopeit was _only_ to show that more power is not more sales, i thing the
jag is a HELL of alot better than the falcon and am very impressed with
the price tag for what you get.

>
>>>As for the production problems, at least part of that was the bad RF
>>>switchboxes. For the national release, that will no longer be a
>>>problem.
>>>

The RF problem is not a real problem (i know better know) but i was taking
about the TOM problem. Secondly i want to state that they still have to
come up with the cdrom, other video connectors, links etc etc...

>>
>>why not ? they don't seem to be that sure about going to full production
>>them selfs do they ?
>
>They seem pretty confident - they say the national roolout is at the

>though.

CBM will not make a powerpc (almost sure) the amiga wants/needs more
floating point power this will come from 68060+dsp(att3210) (low end aaa)
and from a HP/PA RISC.. followed by a HP/PA chip made by commodore & HP
(this is confirmed : they are working on a HP/PA with a 3d raytrace
pipeline).

---------------------------------------- ????

Im not here to flame you but please tell me the multimedia thing i
want to know this .. it is driving me nuts for a year now (windows seems
to have multimedia too but i have NO IDEA why).

# 3861. _Sim City_ not possible on 68000?

Okay, maybe I'm missing something rather large and obvious here, but
isn't SimCity available for pretty much all the small micro formats? All
of them that use the 68000 (ST, Amiga, Macintosh)?

Besides, the other processors in the Jaguar can be used as the "CPU" as
far as I know. Of course, it's not going to be anywhere near as easy,
but just for argument's sake, I suppose it could be done, right?

There's no way anyone will be able to keep a small marketshare when the PowerPC is faster than everything else, can run any OS, can use any add-ons ... (or so it should be ... )

Multimedia means: Graphics/Sound/Interactive

...and that's it ... my 520 ST is a multimedia machine ..

The RISC chips can be programmed to do the game logic. I believe this would
be plenty fast for any number-crunching in SimCity. The Jag seems to handle
3D-world number-crunching as well as any other machine (Cybermorph).

Never said it would be the end of them.

Are you truly serious? When I said it's an option, I meant that every machine out there that says it plays movies needs extra hardware to do it. You have to go out and buy it and hook it up to your machine. In the Jag's case, the CD-ROM is needed to play movies, as well as a cartridge.

Multimedia is a stupid term. It means whatever you want it to mean. It means pictures, sounds, text, video, and/or whatever else you want to throw in.
